Mechanical and Electro-Mechanical Product Solutions by Danaher Motion

Danaher Motion engineers, manufactures and markets a select combination of the world's top brands of mechanical and electro-mechanical products. Our principle brands and products include:

- THOMSON industrial, precision and rodless actuators, linear slide tables and systems, ball and lead screws, linear bearings and guides, precision balls, molded products, shafting and integrated solutions
- THOMSON BSA lead screws and precision miniature ball screws
- MICRON gearheads
- HAROWE resolvers
- DELTRAN PT electromagnetic friction and wrap spring clutches and brakes
- SUPERIOR ELECTRIC stepper and servo motors and controls
- SECO AC and DC variable speed drives

Designed to help increase productivity and improve performance, our products are incorporated into new equipment designs as well as machines already in service. From semiconductor assembly, packaging, robotics and industrial automation to medical, fitness and mobile off-highway equipment, our mechanical and electro-mechanical products bring flexibility, precision, efficiency, and reliability to a wide variety of industries.

Beyond our world-class product designs, one of our greatest strengths is our commitment to the Danaher Business System (DBS), which is comprised of a unique set of robust, repeatable processes that help us constantly improve the operational efficiency of our factories. Based upon the time-tested methods of Kaizen, the DBS is a team-based mindset that continuously and aggressively eliminates waste in every facet of our business operations. Furthermore, the DBS focuses the entire organization on breakthrough objectives that culminate in maintainable, results-oriented business processes, which, in turn, create advantages for our customers in the areas of quality, delivery and performance.

At Danaher Motion, we bring together best-in-class products, unsurpassed customization expertise, and innovative solutions to significantly improve and revolutionize the way things move. We are the experts in motion control. In short, Danaher Motion offers more choices, more application expertise and more integrated solutions than anyone else in the market.

Thomson Linear Motion ComponentsThe RoundRail* Advantage...

Super Smart Ball Bushing* Bearings

Thomson Super Smart Ball Bushing Bearings represent a major advancement for Linear bearing technology, worldwide.

This new patented self-aligning linear bearing provides twice the load carrying capacity or eight times the travel life of the industry standard Thomson Super Ball Bushing* bearing. This dramatic increase in load capacity allows the use of less expensive drive motors, linkages, gears and ball screws. The unique Super Smart design allows the bearing to maintain its diametrical fit up when installed in housings that are soft or slightly out-of-round. Super Smart bearings utilize the RoundRail Advantage that eliminates the need for derating factors commonly used with linear guides. The new bearings are called "Smart" because their universally self-aligning, double-track design incorporates engineering concepts that literally render old style conventional bearings obsolete. Available in inch and metric sizes from over 1800 distributors worldwide. (See Page 16)

Super Smart Ball Bushing Pillow Blocks

Thomson Super Smart Ball Bushing Pillow Blocks available in closed, adjustable and open styles in both single and twin versions.

To minimize installation time and cost, the Super Smart Ball Bushing bearing can be ordered factory-installed in an industry standard single or twin pillow block. The closed type pillow block is used in end supported applications for spanning or bridging a gap. The open style is used in continuously supported applications when maximum rigidity and stiffness is required. Each Super Smart Pillow block is complete with integral double acting seals which keep out contaminants, retain lubrication and maximize bearing life. Since each Pillow Block is dimensionally interchangeable with the industry standard Thomson Super Ball Bushing Pillow Block, system performance improvements can be realized immediately. All Pillow Blocks are available and in stock from over 1800 authorized distributors worldwide (See Page 18)

Super Ball Bushing Bearings

Industry standard self-aligning Super Ball Bushing Bearings available in twenty three sizes and configurations.

Super Ball Bushing bearings offer three times the load capacity or twenty seven times the life of conventional linear bearings. Industry standard self-aligning Super Ball Bushing bearings ease installation and minimize wear from minor bore misalignment. Super Ball Bushing bearings can achieve speeds up to 10 ft/s and accelerations up to 450 ft/s² without the derating factors commonly found in linear guide products. With a coefficient of friction as low as .001, Super Ball Bushing bearings provide a quick easy replacement for high friction plain bearings. The wear-resistant, engineered-polymer retainers and outer sleeves reduce inertia and noise in critical, high speed applications. Super Ball Bushing bearings are available in both open and closed versions from over 1800 distributors worldwide. (See Page 44)

Website: www.thomsonballbushing.com

Product Overview

...The RoundRail* Advantage- The inherent ability of a RoundRail Ball Bushing* bearing system to accommodate torsional misalignment (caused by inaccuracies in carriage or base machining or by machine deflection) with little increase in stress to the bearing components.

Super Ball Bushing* Bearing Pillow Blocks

Available in closed, adjustable and open styles in both single and twin versions.

Thomson Super Ball Bushing bearings are also available factory installed in single or twin pillow blocks. Super Ball Bushing bearing pillow blocks are provided with integral, double acting seals that keep out contaminants and retain lubrication, maximizing system performance and life. Twin versions provide up to twice the load capacity or eight times the life of single versions, allowing the use of smaller and less expensive drives, motors and ball screws. When replacing v-ways and flat-ways, the Super Pillow Block's low coefficient of friction reduces power consumption and provides important design economies. In stock and available in sizes from 1/4 to 2 inch from over 1800 distributors worldwide. (See Page 50)

Precision Steel Ball Bushing Bearing Products

Rigid, Precision Steel Ball Bushing Bearing design eliminates binding and chatter found in high friction plain bearings.

Precision Steel Ball Bushing bearings are available in an open version for continuously supported applications and a closed version for end supported applications. Extra precision and adjustable versions are available for end supported applications requiring higher precision and repeatability. Precision Steel Ball Bushing bearing products are also available factory installed in a self-aligning, malleable iron pillow block minimizing installation time and cost. The all-steel design makes the Precision Steel Ball Bushing bearing product line perfect for replacing plain bearings in high temperature applications. Available in 72 sizes and configurations from over 1800 distributors worldwide. (See Page 74)

Miniature Instrument Ball Bushing Bearings

High Accuracy and Compactness for Instrumentation Level Applications.

The accuracy level and compact size make the Instrument Ball Bushing bearing ideal for small mechanisms or devices that require high repeatability and responsiveness. When replacing high friction plain bearings, the Instrument Ball Bushing bearings' constant low coefficient of friction eliminates stick-slip and provides smooth linear performance. Each Instrument Ball Bushing bearing can be provided with a matched 60 Case* LinearRace* shafting for minimum fit-up, optimizing system performance and accuracy. In stock and available in sizes 1/8, 3/16 and 1/4 inch from over 1800 distributors, worldwide. (See Page 82)

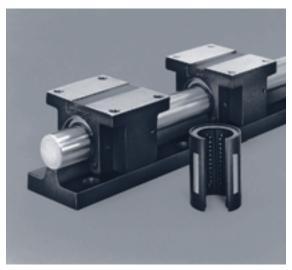

Thomson Linear Motion Components The RoundRail* Advantage

Die Set Ball Bushing* Bearings

Available in two accuracy classes and suitable for a variety of industrial applications.

Thomson Die Set Ball Bushing bearings are designed to fit the mounting holes of the punch holder in standard dies. When replacing high friction plain bearings in standard dies, the result is less machine downtime and increased efficiency. With steady state speeds up to 10 ft/s, the Die Set bearing will provide faster cycle times, with improvements in production rates realized immediately. Matched precision ground 60 Case* LinearRace* allows for a close fit-up between the shaft and the LinearRace shafting and bearing providing critical die alignment. When normal machine service requires bearing replacement, the Die Set bearing can be removed by simply unbolting the toe clamps. Available in 1, 11/4, 11/2 and 2 inch sizes from over 1800 distributors worldwide. (See Page 84)

XR* Ball Bushing Bearing Products

High load capacity and rigidity combined with the RoundRail Advantage.

The XR Ball Bushing bearing provides five times the load capacity or 125 times the life of conventional linear bearings. This increase in bearing performance significantly reduces downtime and maintenance, while increasing machine reliability. When replacing v-ways and flat-ways, XR Ball Bushing bearings allow travel speeds up to 5 ft/s and accelerations up to 225 ft/s² without a sharp increase in power consumption. XR Ball Bushing bearings also provide three times the rigidity of conventional Ball Bushing bearings reducing deflection in critical machining applications. Pillow Blocks are available with factory installed XR Ball Bushing bearings and integral seals. 60 Case LinearRace shafting available premounted on standard extra rigid LinearRace support rails. Available in 2, 3 and 4 inch sizes from over 1800 distributors worldwide. (See Page 98)

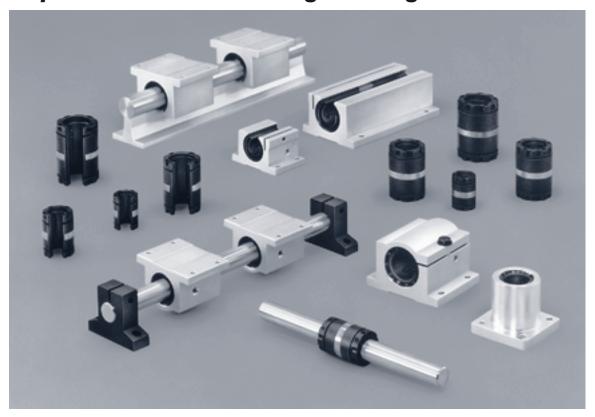

RoundWay* Linear Roller Bearings

Low friction roller bearings with up to 20 times the load capacity of conventional linear bearings.

These patented, self-aligning linear roller bearings have over 20 times the load capacity of a conventional linear ball bearing. This dramatic increase in bearing load capacity allows designers to optimize system compactness and minimize hardware costs. Combining the self-aligning feature with the RoundRail Advantage minimizes installation time and assures trouble-free operation. RoundWay and RoundWay II bearings can achieve operating speeds up to 10 ft/s without the derating factors commonly seen with linear guides. When normal machine maintenance is required, RoundWay bearings can be quickly and cost-effectively replaced, without scrapping the entire system, a major problem when servicing some linear guides. RoundWay bearings are available from over 1800 authorized distributors worldwide. (See Page 110)

/T/THOMSON

Super Smart Ball Bushing Bearing Products

Thomson Super Smart Ball Bushing* Bearing products offer:

- up to six times the load capacity or 216 times the travel life of conventional linear bearings.
- twice the load capacity or eight times the travel life of industry standard Thomson Super Ball Bushing* bearings.
- a precision super finished, dual track bearing plate for optimum system smoothness and performance.
- a universal self-alignment feature, that compensates for misalignment of housing bores and 60 Case* LinearRace* shaft deflection, optimizes load distribution between ball tracks and assures uniform ball loading over the entire length of the bearing plate. Installation time and cost is minimized while bearing performance and life is maximized.

- a technologically advanced design that allows the bearing to maintain its diametrical fit-up when installed in a housing that is slightly out-of-round.
- longer travel life and minimal machine downtime when replacing conventional linear bearings or the industry standard Super Ball Bushing bearing.
- the RoundRail* Advantage combined with universal self-alignment eliminating the need for derating factors commonly required when using linear guides.
- a coefficient of friction as low as .001. This allows the use of smaller less expensive motors, belts, gears and ball screws, when replacing high friction, plain bearings.
- closed and open configurations.
- double lip integral wipers that keep out dirt while retaining lubrication. Travel life is maximized.
- worldwide availability from over 1800 authorized distributors.

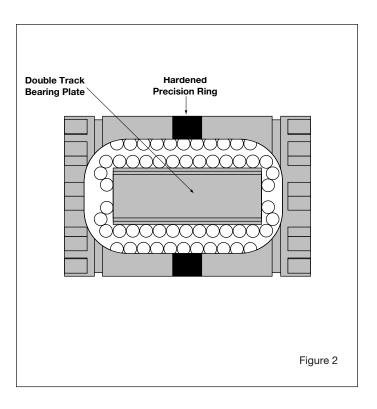

Super Smart Ball Bushing Bearing

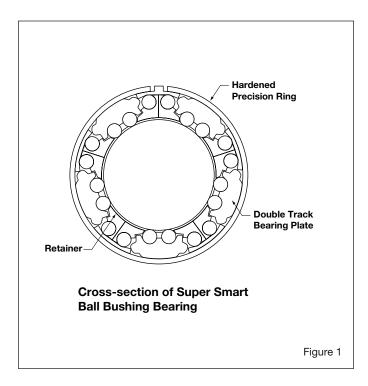

The new Super Smart Ball Bushing* bearing represents a major advancement in linear bearing technology worldwide. The Super Smart Ball Bushing bearing offers twice the load capacity or eight times the travel life of the industry standard Thomson Super Ball Bushing* bearing. An enormous technological breakthrough, considering the Super Ball Bushing bearing already offers three times the load capacity or twenty-seven times the travel life of conventional linear bearings.

Technologically Advanced Design

The load carrying component of the Super Smart Ball Bushing bearing is the combination of four hardened bearing quality steel components (Figures 1 & 2).

The first component is the steel outer ring, which allows the bearing to maintain its diametrical fit-up even when installed in a housing that is slightly out-of-round. The unique ring design also allows for bearing adjustment and the removal of diametrical clearance. The second component is the precision super finished double track bearing plate that provides twice the load capacity and features universal self-alignment.

The third component is the rolling element. Each Super Smart Ball Bushing bearing utilizes precision ground balls manufactured to the highest quality standards for roundness and sphericity. The result is maximum load capacity, travel life and performance.

The last component is the 60 Case* LinearRace* shaft that acts as the inner race to the Super Smart Ball Bushing bearing. Each 60 Case LinearRace shaft is manufactured to the highest quality standards for roundness, straightness, surface finish and hardness. Roundness is held under eighty millionths of an inch; straightness to .002 inches per foot; surface finish under twelve microinch and hardness between 60-65 HRC. The combination of inner and outer race or 60 Case LinearRace shaft and Super Smart Ball Bushing bearing provides the basis for the RoundRail* Advantage.

The RoundRail Advantage

The RoundRail Advantage is the inherent ability of a Super Smart Ball Bushing bearing system to accommodate torsional misalignment (caused by inaccuracies in carriage or base machining or by machine deflection) with little increase in stress to bearing components. Installation time and cost are minimized and system performance is maximized.

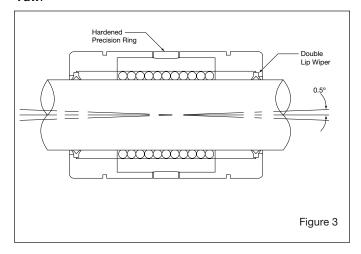

Website: www.thomsonballbushing.com

Super Smart Ball Bushing Bearing

Universal Self-Alignment

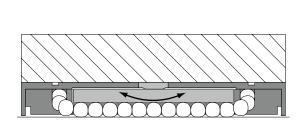

The bearing plate of the Super Smart Ball Bushing* bearing is designed with many unique and technologically advanced features. The universal self-alignment feature assures that the Super Smart Ball Bushing bearing will achieve maximum performance regarding load capacity, travel life, smooth operation and coefficient of friction. The three components that make up universal self-alignment are **Rock**, **Roll** and **Yaw**.

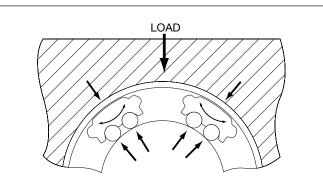

Rock

The bearing plate is designed to rock 0.5° about the hardened precision ground outer ring (Figures 3 & 4). This self-aligning feature allows the Super Smart Ball Bushing bearing to absorb misalignment caused by inaccuracies in housing bore alignment or 60 Case* LinearRace* shaft deflection.

This rocking capability provides smooth entry and exit of the precision balls into and out of the load zone assuring a constant low coefficient of friction. By compensating for misalignment, each bearing ball in the load carrying area is uniformly loaded providing maximum load capacity.

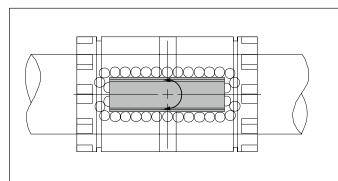

Close-up of hardened precision ring, showing how the bearing plate self-aligns (rocks) about the curved surface of the ring.

Close-up of double track bearing plates showing how they self-align (**roll**) to evenly distribute the load on each of their two ball tracks. Figure 5

Roll

The second key design feature of the Super Smart Ball Bushing bearing plate is its ability to **Roll**. The bearing plate is designed with the radius of its outer surface smaller than the inside radius of the precision outer ring (Figure 5). This allows the bearing plate to compensate for torsional misalignment and evenly distribute the load on each of its two ball tracks. The roll component assures maximum load capacity and travel life.

Bearing plates rotate about their center to prevent skewing relative to the 60 Case LinearRace shaft.

Figure 6

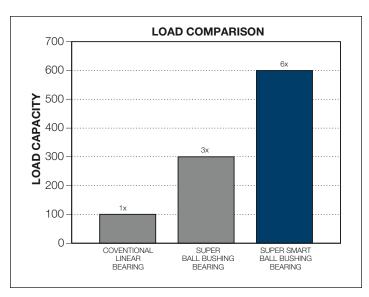

Yaw

The shape formed by the **Rock** and **Roll** features allows the Super Smart Ball Bushing bearing plate to rotate about its center (Figure 6). This allows the Super Smart Ball Bushing bearing to absorb skew caused by misalignment. The result is a constant low coefficient of friction and maximum bearing performance.

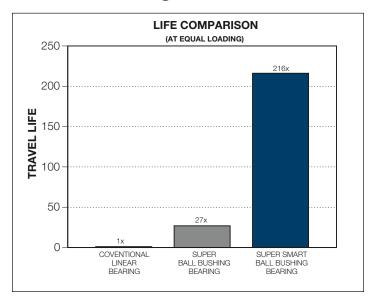

Super Smart Ball Bushing Bearing The Super Smart Advantage

Advantage: Load Capacity

The Super Smart Ball Bushing* bearing provides twice the load capacity of the industry standard Thomson Super Ball Bushing* bearing and six times the load capacity of conventional linear bearings.

Advantage: Travel Life

The Super Smart Ball Bushing bearing provides eight times the travel life of the industry standard Thomson Super Ball Bushing bearing and 216 times the travel life of conventional linear bearings.

Super Smart Ball Bushing Bearings and Pillow Blocks for End Supported Applications

Super Smart Ball Bushing* Bearings (Closed Type) Features:

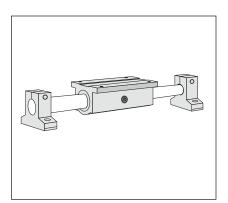

- Available in sizes ½ to 1½ inch diameters.
- Load capacity range from 265 to 3,880 lb_f.
- Available with one, two or without integral double lip wipers.
- Can be adjusted to take out diametrical clearance.
- Can be mounted in a customized housing.
- Travel speeds up to 10 ft/s.
- Interchangeable with the industry standard Thomson Super Ball Bushing* bearing.

Super Smart Ball Bushing Pillow Blocks (Closed and Adjustable Type) Features:

- Available in sizes ½ to 1½ inch diameters.
- Load capacity range from 265 to 3,880 lb_f.
- Available with standard integral double acting seals.
- Available with or without adjustment capability.
- Can be adjusted to take out diametrical clearance.

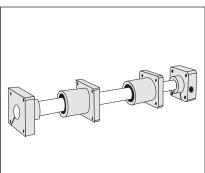

- Easily mounted and secured with four mounting bolts.
- Travel speeds up to 10 ft/s.
- Available with standard lubrication fitting.
- Interchangeable with the industry standard Thomson Super Ball Bushing Pillow Blocks.

Super Smart Ball Bushing Twin Pillow Blocks (Closed and Adjustable Type) Features:

- Available in sizes ½ to 1½ inch diameters.
- Load capacity range from 530 to 7,760 lb_f.
- Available with standard integral double acting seals.
- Available with or without adjustment capability.
- Can be adjusted to take out diametrical clearance.

- Travel speeds up to 10 ft/s.
- Easily mounted and secured with four mounting bolts.
- Available with standard lubrication fitting.
- Interchangeable with the industry standard Thomson Super Ball Bushing Twin Pillow Block.

Page 12

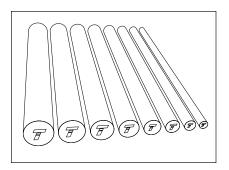

Super Smart Ball Bushing Flanged Single and Twin Pillow Blocks Features:

- Available in sizes ½ and 1½ inch diameters.
- Load capacity range from 265 to 7,760 lb_f.
- Available with standard integral double acting seals.
- Without adjustment capability.
- Can be mounted perpendicular to table surface.
- Easily mounted and secured with four mounting bolts.
- Travel speeds up to 10 ft/s.
- Available with standard lubrication fitting.
- Interchangeable with the industry standard Thomson Super Ball Bushing Flanged Single and Twin Pillow Block.

60 Case LinearRace Shafting for End Supported Applications

Solid 60 Case* LinearRace* Shafting Features:

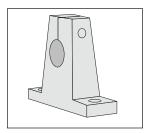

- Diameter range between 3/16 and 4 inch.
- Roundness 80 millionths of an inch.
- Case hardness 60 HRC minimum.
- Surface finish 12 R_a microinch.
- Available in corrosion resistant 440C stainless steel (50 HRC minimum).
- Available with PrePlate* chrome option.
- Standard straightness is .001 inch per foot cumulative (.002 TIR) with special straightness at .0005 inch per foot cumulative (.001 TIR) available.

60 Case Tubular Lite* LinearRace Shafting Features:

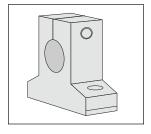

- Hollow inner diameter reduces weight and inertia.
- Diameter range between ¾ and 4 inch.
- Roundness 80 millionths of an inch.
- Case hardness 58 HRC minimum.
- Surface finish 12 R_a microinch.
- Available with PrePlate chrome option.
- Standard straightness is .001 inch per foot cumulative (.002 TIR) with special straightness at .0005 inch per foot cumulative (.001 TIR) available.

60 Case LinearRace Supports For End Supported Applications

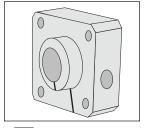

SB 60 Case LinearRace Shafting End Support Block

- Size range between 1/4 and 2 inch.
- Easily secured with two mounting bolts.
- Malleable iron alloy for sizes ½ to 2 inch diameter.
- Protected by corrosion resistant coating.
- Light weight, high strength aluminum alloy construction for sizes ¼ and ¾ inch.

ASB Low Profile 60 Case LinearRace Shafting End Support Block Features:

- Size range between 1/4 and 11/2 inch.
- Low profile design.
- Easily secured with two mounting bolts.
- Protected by corrosion resistant anodized coating.
- Light weight, high strength aluminum alloy construction.

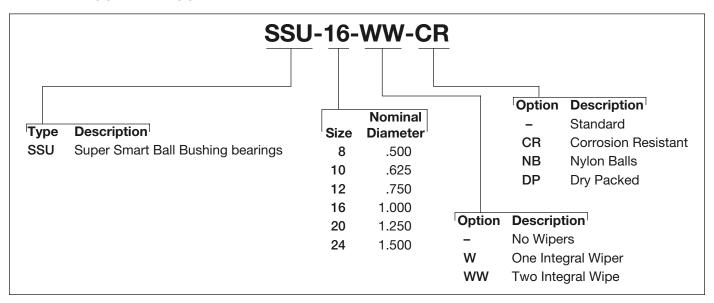

FSB Flanged 60 Case LinearRace End Support Block Features:

- Available in ½, ¾, 1 and 1¼ inch diameters.
- Flanged mounting surface for easy assembly.
- Easily secured with four mounting bolts.
- Designed specifically for use with Super Smart Flanged Pillow Blocks
- Protected by corrosion resistant coating.
- Light weight, high strength aluminum alloy construction.

Load/Life Graph (Lines indicate limiting load for given Ball Bushing* bearing)

‡P=Preload, C=Clearance

Determining Ball Bushing Bearing Size

To determine the proper Ball Bushing bearing size enter the chart with the maximum load of the most heavily loaded bearing and the required travel life. Mark where the two lines intersect. All Ball Bushing bearing sizes that pass through or above and to the right of this point may be suitable for this application.

Note: For the purpose of using this chart. Load on most heavily loaded bearing = maximum applied load/ $K_{\rm o}$.

Where $K_{\scriptscriptstyle 0}$ can be determined from the Polar Graph to the right.

- (1) The Dynamic Load Capacity is based on a rated travel life of 2 million inches. The actual Dynamic Load Capacity can be affected by the orientation of the bearing or the direction of the applied load. For dynamic load correction factors see polar graphs below.
- ⁽²⁾ For part number description and specifications see page 14 and 15. For specifications on seals and retaining rings see the Accessories section. Note: For additional technical data, see Engineering Support Appendix.

Polar Graphs

The actual Dynamic Load Capacity of a Ball Bushing* bearing is determined by the orientation of the bearing or direction of the applied load. The load Correction Factor K₀ is found by knowing the direction of the applied load relative to the orientation of the bearings ball tracks and referring to the polar graph. To determine the actual Dynamic Load Capacity, multiply the proper correction factor by the Dynamic Load Capacity listed in the product table on the previous page.

Load/Life Graph (Lines indicate limiting load for given Ball Bushing* Pillow Block)

Determining Ball Bushing Bearing Size

To determine the proper Ball Bushing bearing size enter the chart with the maximum load of the most heavily loaded bearing and the required travel life. Mark where the two lines intersect. All Ball Bushing bearing sizes that pass through or above and to the right of this point may be suitable for this application.

Note: For the purpose of using this chart. Load on most heavily loaded bearing = maximum applied load/K₀.

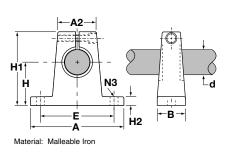

Where K₀ can be determined from the Polar Graph to the right.

- (1) The Dynamic Load Capacity is based on a rated travel life of 2 million inches. The actual Dynamic Load Capacity can be affected by the orientation of the bearing or the direction of the applied load. For dynamic load correction factors see polar graphs below. Dynamic load capacity of Twin Super Smart Flanged Pillow blocks is based on two bearings equally loaded.
- ⁽²⁾ For part number description and specifications see page 14 & 15.

 Note: For additional technical data, see the Engineering Support Appendix.

Polar Graphs

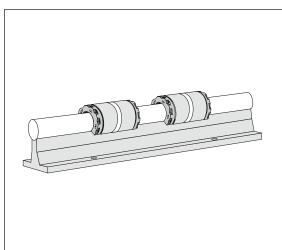

The actual Dynamic Load Capacity of a Ball Bushing* bearing is determined by the orientation of the bearing or direction of the applied load. The load Correction Factor K_0 is found by knowing the direction of the applied load relative to the orientation of the bearings ball tracks and referring to the polar graph. To determine the actual Dynamic Load Capacity, multiply the proper correction factor by the Dynamic Load Capacity listed in the product table on the previous page.

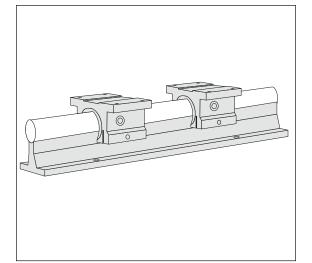

Super Smart Ball Bushing Bearings and Pillow Blocks (Open Type)

for Continuously Supported Applications

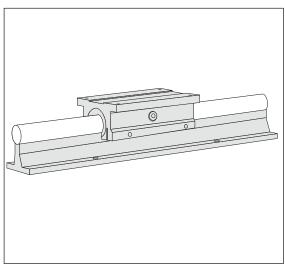

Super Smart Ball Bushing* Bearing (Open Type) Features:

- Available in sizes ½ to 1½ inch diameter.
- Load capacity range from 360 to 3,880 lbf.
- Pull off load capacity range from 250 to 1,750 lb_f.
- Available with one, two or without double lip integral wipers.
- Can be adjusted to take out diametrical clearance.
- Can be mounted in a customized open style pillow block.
- Travel speeds up to 10 ft/s.
- Interchangeable with the industry standard Thomson Super Ball Bushing* bearing (open type).

Super Smart Ball Bushing Pillow Blocks (Open Type) Features:

- Available in sizes ½ to 1½ inch diameter.
- Load Capacity range from 360 to 3,880 lbf.
- Pull off load capacity range from 250 to 1,750 lbf.
- Available with standard double acting integral seals.
- Can be adjusted to take out diametrical clearance.
- Easily mounted and secured with four mounting bolts.
- Travel speeds up to 10 ft/s.
- Available with standard lubrication access.
- Interchangeable with the industry standard Thomson Super Ball Bushing Pillow Block (Open Type).

Super Smart Ball Bushing Twin Pillow Blocks (Open Type) Features:

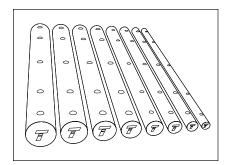

- Available in sizes ½ to 1½ inch diameter.
- Load Capacity range from 720 to 7,760 lbf.
- Pull off load capacity range from 500 to 3,500 lbf.
- Available with standard double acting integral seals.
- Can be adjusted to take out diametrical clearance.
- Easily mounted and secured with four mounting bolts.
- Travel speeds up to 10 ft/s.
- Available with standard lubrication access.
- Interchangeable with the industry standard Thomson Super Ball Bushing Twin Pillow Block (Open Type).

60 Case LinearRace Shafting (PreDrilled) for Continuously Supported Applications

Solid 60 Case* LinearRace* shafting with Mounting Holes Features:

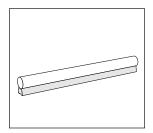

- Radial drilled and tapped holes ready for immediate use with standard hole spacing to match standard 60 Case LinearRace support rails.
- Diameter range between ½ and 4 inch.
- Surface finish 12 R_a microinch.
- Hardness 60 HRC minimum.
- · Roundness 80 millionths of an inch.
- Available in corrosion resistant 440C stainless steel (50 HRC min).
- Available with Preplate chrome option.
- Standard straightness .001 inch per foot cumulative (.002 TIR) with special straightness at .0005 inch per foot cumulative (.001 TIR) available.

60 Case Tubular Lite LinearRace shafting with Mounting Holes Features:

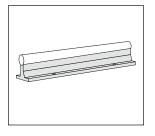

- Hollow design reduces weight and inertia.
- Radial drilled and tapped holes ready for immediate use.
- Standard hole spacing to match standard 60 Case LinearRace support rails.
- Diameter range between 1½ and 4 inch.
- Roundness 80 millionths of an inch.
- Case hardness 58 HRC minimum.
- Surface finish 12 R_a microinch.
- Available with Preplate chrome option.
- Standard straightness .001 inch per foot cumulative (.002 TIR) with special straightness at .0005 inch per foot cumulative (.001 TIR) available.

60 Case LinearRace Support Rails and Assemblies for Continuously Supported Applications

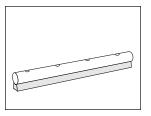

LSR Low Profile 60 Case LinearRace Support Rail Features:

- Diameter range between ½ and 4 inch.
- Available with standard mounting holes for immediate use.
- Available without mounting holes for custom hole spacing.
- Low Profile design.
- Unlimited travel lengths.

SR 60 Case LinearRace Support Rail SRA 60 Case LinearRace Support Rail Assembly Features:

- Diameter range between ½ and 2 inch.
- Available with standard mounting holes for immediate use.
- Available without mounting holes for customized hole spacing.
- Available as a pre-engineered, ready to install assembly.
- Light weight, high strength aluminum alloy rail.
- Unlimited travel lengths.

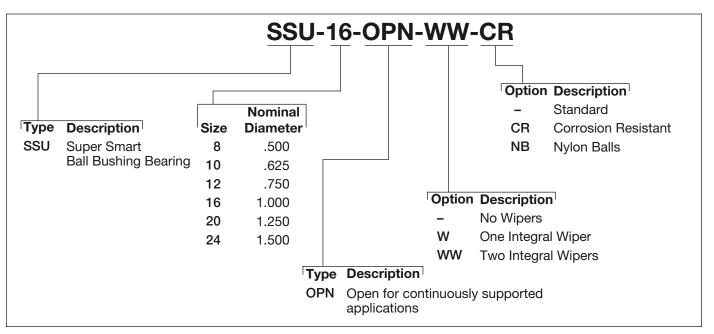

- LSRA Smart Rail* Assembly Features:
- Diameter range between 5/8 and 11/2 inch.
- Bolt-down-from-the-top mounting.
- Two mounting hole patterns.
- Single piece lengths up to 15 feet long.
- Low profile design.

Load/Life Graph (Lines indicate limiting load for given Ball Bushing Pillow Block)

Determining Ball Bushing Bearing Size

To determine the proper Ball Bushing bearing size enter the chart with the maximum load of the most heavily loaded bearing and the required travel life. Mark where the two lines intersect. All Ball Bushing bearing sizes that pass through or above and to the right of this point may be suitable for this application.

Note: For the purpose of using this chart. Load on most heavily loaded bearing = maximum applied load/ $K_{\mbox{\tiny 0}}$.

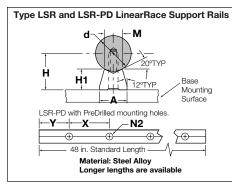

Where $\ensuremath{K_{\scriptscriptstyle{0}}}$ can be determined from the Polar Graph to the right.

Assembly

Polar Graph

The actual Dynamic Load Capacity of a Ball Bushing bearing is determined by the orientation of the bearing or direction of the applied load. The load Correction Factor K₀ is found by knowing the direction of the applied load relative to the orientation of the bearings ball tracks and referring to the polar graph. To determine the actual Dynamic Load Capacity, multiply the proper correction factor by the Dynamic Load Capacity listed in the product table on the previous page. When using LSRA Smart Rail* assemblies, the dynamic load capacity for side loaded or pull off applications must be de-rated by 75% or .25 times the Dynamic Load Capacity.

Pick and Place X-Y System

Objective

Build an X-Y System that transfers the work piece between two separate machining stations.

Solution

Assemble the X-Y System utilizing Super Smart pillow blocks on end supported 60 Case* LinearRace* for the X-axis and continuously supported 60 Case LinearRace on the Y-axis. Utilize Thomson Ball Screw Assemblies for high speed positioning.

Products Specified

X-axis

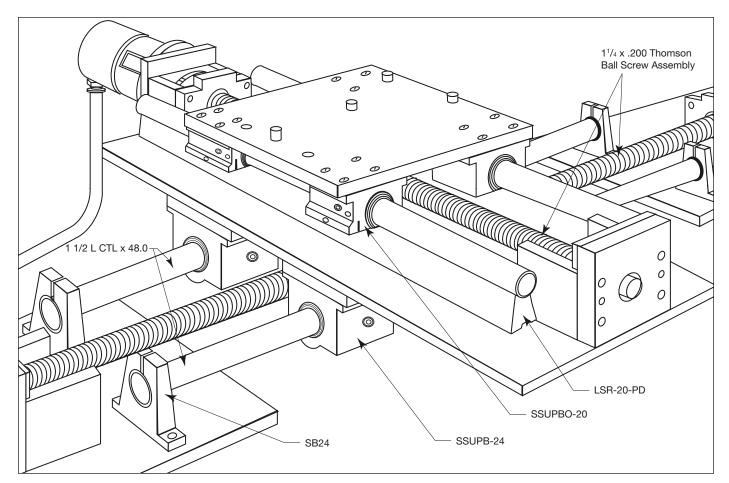

- 2 1 ½ L CTL x 48.00 in (60 Case LinearRace)
- 4 SB24 (60 Case LinearRace End Support Blocks)
- 4 SSUPB-24 (Super Smart Ball Bushing* Pillow Blocks)
- 1 11/4 x .200 (Thomson Ball Screw Assembly)

Y-axis

- 2 LSR-20 x 48.00 in (Low Profile 60 Case LinearRace Support Rail)
- 4 SSUPBO-20 (Super Smart Ball Bushing Pillow Blocks)
- 1 11/4 x .200 (Thomson Ball Screw Assembly)
- 2 11/4 L CTL x 48.00 in (60 Case LinearRace)

Benefits

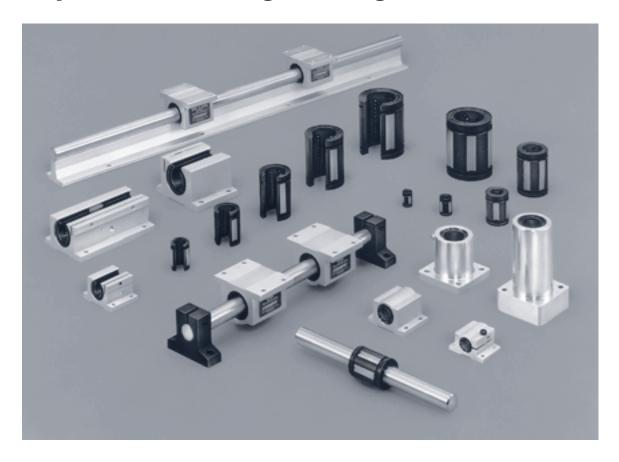

The 60 Case LinearRace and 60 Case LinearRace end support blocks provided an important bridge between machining stations. The Super Smart Ball Bushing pillow blocks and Thomson ball screws provided uninterrupted high speed movement of the work piece. Productivity increased by 200%.

Super Ball Bushing Bearing Products

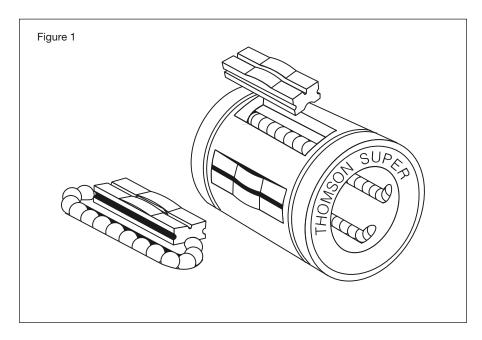

Thomson Super Ball Bushing* Bearing Products offer:

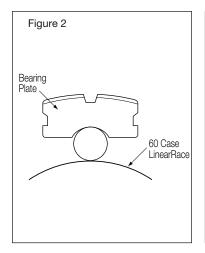

- a self-aligning capability up to .5° compensating for inaccuracies in base flatness or carriage machining.
- the RoundRail* Advantage combined with the self-aligning feature, eliminating the need for derating factors commonly required for linear guides.
- travel speeds up to 10 ft/s without a reduction in load capacity.
- light weight, wear-resistant, engineeredpolymer retainers and outer sleeves that reduce inertia and noise.
- radially floating bearing plates. When installed in an adjustable housing, the Super Ball Bushing bearing may be adjusted to a specific diametrical fit-up for accurate and repeatable movement.

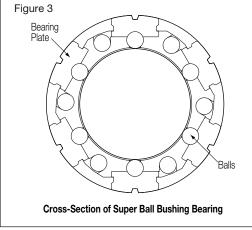

- a constant coefficient of friction as low as .001.
- the use of smaller, less expensive drive motors, belts, linkages, gears and ball screws, when replacing high friction plain bearings.
- a closed configuration for end supported applications and an open configuration for continuously supported applications.
- ready to install pillow blocks with double acting seals and an access for lubrication. Installation and downtime is minimized.
- availability from over 1800 distributors, worldwide.

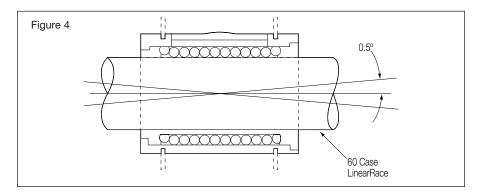

Super Ball Bushing Bearing Products

The Super Ball Bushing* bearing has been the industry standard for selfaligning linear bearings for over twenty years. This bearing provides three times the load capacity or 27 times the travel life of conventional linear bearings. This dramatic improvement in bearing performance significantly reduces downtime and maintenance, while increasing machine reliability. Thomson Industries, Inc. invented the Super Ball Bushing bearing with many unique design features. Besides the dramatic increase in load capacity, the Super Ball Bushing bearing is selfaligning, light weight and adjustable with a low coefficient of friction (Figure 1).

Three Times the Load Capacity

The bearing plates are hardened, bearing quality steel with ball conforming grooves (Figure 2). The groove is slightly larger than the ball diameter, providing an optimal area for ball contact. The greater ball to bearing plate contact provides the increase in load capacity or travel life.

Zero Clearance Fit

The bearing plates are also designed to float radially (Figure 3). When the bearing is mounted in an adjustable housing, selected fit-ups can be achieved on the 60 Case* LinearRace* (shaft).

Self-Aligning

The Super Ball Bushing bearing plates pivot .5° about their centers (Figure 4) to assure smooth entry and exit of the precision bearing balls. Each plate aligns itself automatically to compensate for inaccurate housing bore alignment, base flatness or carriage machining. This provides uniform ball loading, smooth ball recirculation and a constant coefficient of friction.

Smooth, Quiet Operation

The Super Ball Bushing bearing's outer sleeve and retainer are made of wear-resistant, low-friction engineering polymer. It reduces inertia and operating noise levels significantly.

for End Supported Applications40

Super Ball Bushing* bearing closed type products are designed specifically for use in end supported applications where spanning or bridging a gap is required. End support products are available in a variety of configurations and sizes. For a complete overview of each Super Ball Bushing end support product turn to page 40. For product specifications see the pages referenced below.

Product Overview	40

Super Ball Bushing Cartridge Bearings	48
Super Ball Bushing Pillow Blocks (Closed Type)	50
Super Ball Bushing Twin Pillow Blocks (Closed Type)	52

Super Ball Bushing Bearing Products for Continuously Supported Applications54

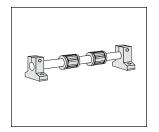

Super Ball Bushing Bearing open type products are specifically designed for use in continuously supported applications, where rigidity and stiffness is required. Continuously supported products are available in a variety of configurations and sizes. For a complete overview of all Super Ball Bushing bearing continuously supported products turn to page 54. For Super Ball Bushing continuously supported product specifications, see the corresponding pages referenced below.

Super Ball Bushing Bearings and Pillow Blocks for End Supported Applications

Super Ball Bushing* Bearings (Closed type) Features:

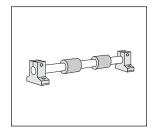

- Available in sizes 3/16 to 2 inch diameter.
- Load Capacity range from 35 to 3,000 lbf.
- Self-aligning in all directions.
- Can be mounted in a custom housing.
- Can be adjusted to take out diametrical clearance.
- Travel speeds up to 10 ft/s.
- Available with corrosion resistant components.

Sealed Super Ball Bushing Bearings (Closed type)

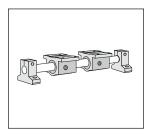

- Integral double acting seals retain lubrication and keep out contamination.
- Available in sizes ½, ¾ and 1 inch nominal diameter.
- Load capacity range from 255 to 1,050 lb_f.
- Self-aligning in all directions.

- Can be adjusted to take out diametrical clearance.
- Can be mounted in a custom housing.
- Travel speeds up to 10 ft/s.
- Available with corrosion resistant components.

Super Ball Bushing Cartridge Bearings Features:

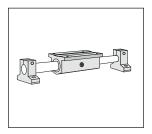

- Available in sizes 1/4, 3/8 and 1/2 inch diameter.
- Can be easily installed into a soft or slightly out-of-round housing.
- Available in both single or twin versions and with or without integral double acting seals.
- Single versions are self-aligning in all directions.
- Twin versions minimize installation time and cost.
- Available with corrosion resistant components.

Super Ball Bushing Pillow Blocks (Closed and Adjustable Type) Features:

- Available in sizes 1/4 to 2 inch diameter.
- Load capacity range between 60 and 3,000 lb_f.
- Available with standard integral double acting seals.
- Travel speeds up to 10 ft/s.

- Available with or without diameter adjustment capability.
- Easily mounted and secured with four mounting bolts (sizes ½ and ½ secured with two mounting bolts).
- Available with a standard lubrication access.

Super Ball Bushing Twin Pillow Blocks (Closed and Adjustable Type) Features:

- Available in sizes 1/4 to 11/2 inch diameter.
- Load capacity range between 120 and 4,000 lb_f.
- Available with standard integral double acting seals.
- Travel speeds up to 10 ft/s.

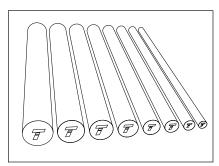

- Available with or without diameter adjustment capability.
- Easily mounted and secured with four mounting bolts.
- Available with a standard lubrication access.

60 Case LinearRace Shafting

for End Supported Applications

60 Case* Solid LinearRace* Shafting Features:

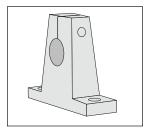

- Diameter range between 3/16 and 4 inch.
- Roundness 80 millionths of an inch.
- Case hardness 60 HRC minimum.
- Surface finish 12 Ra microinch.
- Available in corrosion resistant 440C stainless steel (50 HRC minimum).
- Available with PrePlate* chrome option.
- Standard straightness is .001 inch per foot cumulative (.002 TIR) with special straightness at .0005 inch per foot cumulative (.001 TIR) available.

60 Case Tubular Lite* LinearRace Shafting Features:

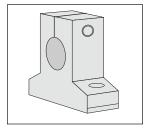

- Hollow inner diameter reduces weight and inertia.
- Diameter range between ¾ and 4 inch.
- Roundness 80 millionths of an inch.
- Case hardness 58 HRC minimum.
- Surface finish 12 R_a microinch.
- Available with Preplate chrome option.
- Standard straightness is .001 inch per foot cumulative (.002 TIR) with special straightness at .0005 inch per foot cumulative (.001 TIR) available.

60 Case LinearRace Supports For End Supported Applications

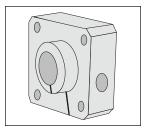

SB 60 Case LinearRace End Support Block Features:

- Size range between 1/4 and 2 inch.
- Easily secured with two mounting bolts.
- Malleable iron alloy for sizes ½ to 2 inch diameter.
- Protected by corrosion resistant coating.
- Light weight, high strength aluminum alloy construction for sizes 1/4 and 3/8 inch.

ASB Low Profile 60 Case LinearRace End Support Block Features:

- Size range between 1/4 and 11/2 inch.
- Low profile design.
- Easily secured with two mounting bolts.
- Protected by corrosion resistant anodized coating.
- Light weight, high strength aluminum alloy construction.

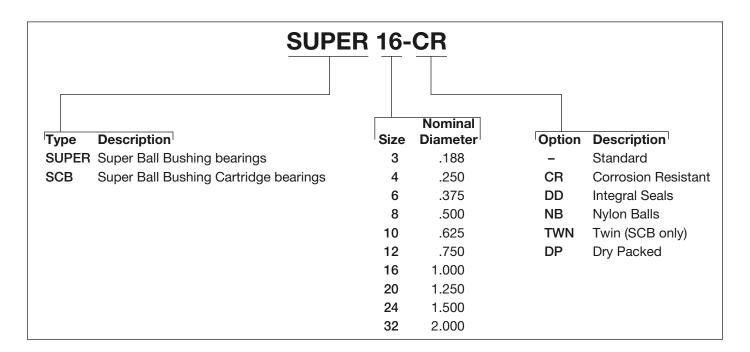

FSB Flanged 60 Case LinearRace End Support Block Features:

- Available in ½, ¾, 1 and 1¼ inch diameters.
- Flanged mounting surface for easy assembly.
- Easily secured with four mounting bolts.
- Designed specifically for use with Super Ball Bushing Flanged Pillow Blocks
- Protected by corrosion resistant coating.
- Light weight, high strength aluminum alloy construction.

Load/Life Graph (Lines indicate limiting load for given Ball Bushing bearing)

Determining Ball Bushing Bearing Size

To determine the proper Ball Bushing bearing size enter the chart with the maximum load of the most heavily loaded bearing and the required travel life. Mark where the two lines intersect. All Ball Bushing bearing sizes that pass through or above and to the right of this point may be suitable for this application.

Note: For the purpose of using this chart. Load on most heavily loaded bearing = maximum applied load/ K_0 .

Where K_0 can be determined from the Polar Graph to the right.

⁽¹⁾ The Dynamic Load Capacity is based on a rated travel life of 2 million inches. The actual Dynamic Load Capacity can be affected by the orientation of the bearing or the direction of the applied load. For dynamic load correction factors see polar graphs below.

Polar Graphs

The actual Dynamic Load Capacity of a Ball Bushing bearing is determined by the orientation of the bearing or direction of the applied load. The load Correction Factor K_0 is found by knowing the direction of the applied load relative to the orientation of the bearings ball tracks and referring to the polar graph. To determine the actual Dynamic Load Capacity, multiply the proper correction factor by the Dynamic Load Capacity listed in the product table on the previous page.

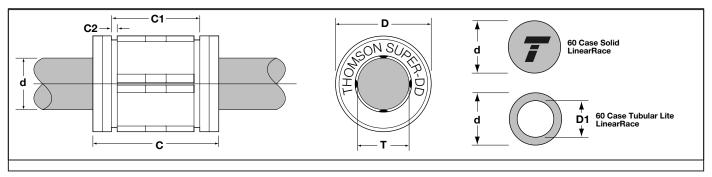

Propart number description and specifications see page 42 and 43. Note: For additional technical data, see Engineering Support Appendix.

Load/Life Graph (Lines indicate limiting load for given Ball Bushing Cartridge Bearing)

Determining Ball Bushing Bearing Size

To determine the proper Ball Bushing bearing size enter the chart with the maximum load of the most heavily loaded bearing and the required travel life. Mark where the two lines intersect. All Ball Bushing bearing sizes that pass through or above and to the right of this point may be suitable for this application.

Note: For the purpose of using this

Load on most heavily loaded bearing = maximum applied load/K₀.

Where $K_{\scriptscriptstyle 0}$ can be determined from the Polar Graph to the right.

- (1) The Dynamic Load Capacity is based on a rated travel life of 2 million inches. The actual Dynamic Load Capacity can be affected by the orientation of the bearing or the direction of the applied load. For dynamic load correction factors see polar graphs below. Dynamic load capacity of Twin Super Cartridge bearing is based on two bearings equally loaded.
- ⁽²⁾ For part number description and specifications see page 42 and 43.

 Note: For additional technical data, see **Engineering Support Appendix**.

Polar Graph

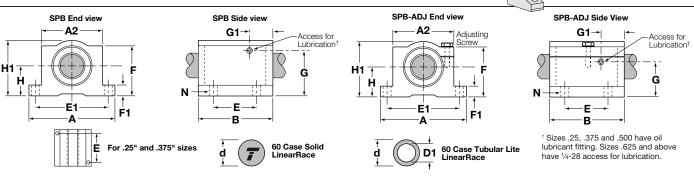

The actual Dynamic Load Capacity of a Ball Bushing bearing is determined by the orientation of the bearing or direction of the applied load. The load Correction Factor K_0 is found by knowing the direction of the applied load relative to the orientation of the bearings ball tracks and referring to the polar graph. To determine the actual Dynamic Load Capacity, multiply the proper correction factor by the Dynamic Load Capacity listed in the product table on the previous page.

The Dynamic Load Capacity is based on a rated travel life of 2 million inches. The actual Dynamic Load Capacity can be affected by the orientation of the bearing or the direction of the applied load. For dynamic load correction factors see polar graphs below. Dynamic load capacity of Super Ball Bushing Twin Pillow Blocks is based on two bearings equally loaded.

Polar Graphs

The actual Dynamic Load Capacity of a Ball Bushing bearing is determined by the orientation of the bearing or direction of the applied load. The load Correction Factor K₀ is found by knowing the direction of the applied load relative to the orientation of the bearings ball tracks and referring to the polar graph. To determine the actual Dynamic Load Capacity, multiply the proper correction factor by the Dynamic Load Capacity listed in the product table on the previous page.

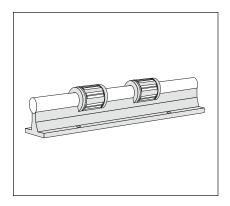

⁽²⁾ For part number description and specifications see page 42 and 43.

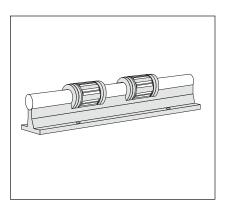

Note: For additional technical data, see Engineering Support Appendix.

Super Ball Bushing Bearings and Pillow Blocks for Continuously Supported Applications

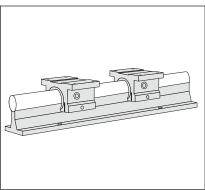

Super Ball Bushing* Bearings (Open Type) Features:

- Available in sizes ½-2 inch diameter.
- Load capacity ranges from 230 to 2,350 lb_f.
- Self-aligning in all directions.
- Can be adjusted to take out diametrical clearance.
- Can be mounted in customized housing.
- Travel speeds up to 10 ft/s.
- Available with corrosion resistant components.

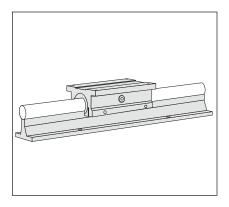

Sealed Super Ball Bushing Bearings (Open Type) Features:

- Standard integral double acting seals retain lubrication and keep out contaminants.
- Available in sizes ½, ¾ and 1 inch diameter.
- Load capacity ranges from 230 to 780 lb_f.
- Self-aligning in all directions.
- Can be adjusted to take out diametrical clearance.
- Can be mounted in customized housing.
- Travel speeds up to 10 ft/s.
- Available with corrosion resistant components.

Super Ball Bushing Pillow Blocks (Open Type) Features:

- Available in sizes ½-2 inch diameter.
- Load capacity ranges from 230 to 2,350 lb_f.
- Self-aligning in all directions.
- Can be adjusted to take out diametrical clearance.
- Travel speeds up to 10 ft/s.
- Standard integral double acting seals retain lubrication and keep out contaminants.
- Available with corrosion resistant components.
- Easily mounted and secured with four mounting bolts.
- Available with standard lubrication access. Sizes .25, .375 and .500 have oil lubricant fitting. Sizes .625 and above have ½-28 access for lubrication.

Super Ball Bushing Twin Pillow Blocks (Open Type) Features:

- Available in sizes ½-1½ inch diameter.
- Load capacity ranges from 460 to 3,120 lb_f.
- Can be adjusted to take out diametrical clearance.
- Available with corrosion resistant components.
- Standard integral double acting seals retain lubrication and keep out contaminants.
- Easily mounted and secured with four mounting bolts.
- Maximum travel speeds up to 10 ft/s.
- Available with standard lubrication access. Sizes .25, .375 and .500 have oil lubricant fitting. Sizes .625 and above have ½-28 access for lubrication.
- Built-in lubrication wick for continuous lubrication.

Super Ball Bushing Bearing

60 Case LinearRace Shafting (PreDrilled) for Continuously Supported Applications

Solid 60 Case* LinearRace* Shafting with Mounting Holes Features:

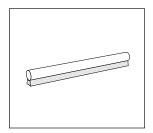

- Radial drilled and tapped holes ready for immediate use with standard hole spacing to match standard 60 Case LinearRace support rails.
- Diameter range between ½ and 4 inch.
- Surface finish 12 R_a microinch.
- Hardness 60 HRC minimum.
- Roundness 80 millionths of an inch.
- Available in corrosion resistant 440C stainless steel (50 HRC minimum).
- Available with Preplate chrome option.
- Standard straightness .001 inch per foot cumulative (.002 TIR) with special straightness at .0005 inch per foot cumulative (.001 TIR) available.

60 Case Tubular Lite LinearRace Shafting with Mounting Holes Features:

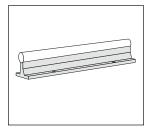

- Hollow design reduces weight and inertia.
- Radial drilled and tapped holes ready for immediate use.
- Standard hole spacing to match standard 60 Case LinearRace support rails.
- Diameter range between 1½ and 4 inch.
- Roundness 80 millionths of an inch.
- Case hardness 60 HRC minimum.
- Surface finish 12 R_a microinch.
- Available with Preplate chrome option.
- Standard straightness .001 inch per foot cumulative (.002 TIR) with special straightness at .0005 inch per foot cumulative (.001 TIR) available.

60 Case LinearRace Support Rails and Assemblies for Continuously Supported Applications

LSR Low Profile 60 Case LinearRace Support Rail Features:

- Diameter range between ½ and 4 inch.
- Available with standard mounting holes for immediate use.
- Available without mounting holes for custom hole spacing.
- Low Profile design.
- Unlimited travel lengths.

SR 60 Case LinearRace Support Rail SRA 60 Case LinearRace Support Rail Assembly Features:

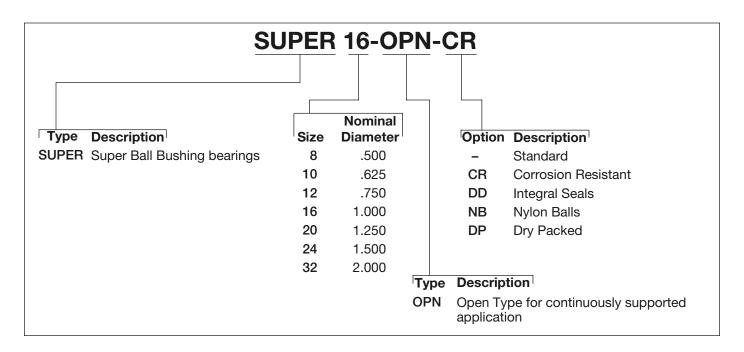

- Diameter range between ½ and 2 inch.
- Available with standard mounting holes for immediate use.
- Available without mounting holes for customized hole spacing.
- Available as a pre-engineered, ready to install assembly.
- Light weight, high strength aluminum alloy rail.
- Unlimited travel lengths.

Load/Life Graph (Lines indicate limiting load for given Ball Bushing bearing)

Determining Ball Bushing Bearing Size

To determine the proper Ball Bushing bearing size enter the chart with the maximum load of the most heavily loaded bearing and the required travel life. Mark where the two lines intersect. All Ball Bushing bearing sizes that pass through or above and to the right of this point may be suitable for this application.

Note: For the purpose of using this chart.

Load on most heavily loaded bearing = maximum applied load/ K_{0} .

Where $K_{\mbox{\tiny 0}}$ can be determined from the Polar Graph to the right.

⁽¹⁾ The Dynamic Load Capacity is based on a rated travel life of 2 million inches. The actual Dynamic Load Capacity can be affected by the orientation of the bearing or the direction of the applied load. For dynamic load correction factors see polar graphs below.

⁽⁹⁾ For part number description and specifications see page 56 and 57. Note: For additional technical data, see **Engineering Support Appendix.**

SR	SR-PD	SRA	24	72

Polar Graphs

The actual Dynamic Load Capacity of a Ball Bushing bearing is determined by the orientation of the bearing or direction of the applied load. The load Correction Factor K_0 is found by knowing the direction of the applied load relative to the orientation of the bearings ball tracks and referring to the polar graph. To determine the actual Dynamic Load Capacity, multiply the proper correction factor by the Dynamic Load Capacity listed in the product table on the previous page.

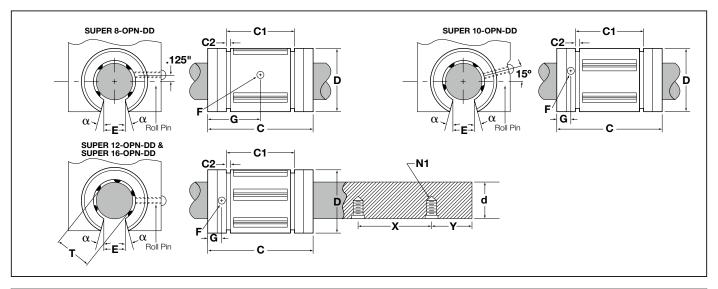

For the maximum length of all 60 Case LinearRace Support Rail Assemblies without 60 Case LinearRace Joints see maximum length table on page 57. 60 Case LinearRace Support Rail Assemblies are available with 60 Case LinearRace joints for unlimited travel lengths.

Load/Life Graph (Lines indicate limiting load for given Ball Bushing Pillow Block)

Determining Ball Bushing Bearing Size

To determine the proper Ball Bushing bearing size enter the chart with the maximum load of the most heavily loaded bearing and the required travel life. Mark where the two lines intersect. All Ball Bushing bearing sizes that pass through or above and to the right of this point may be suitable for this application.

Note: For the purpose of using this chart. Load on most heavily loaded bearing = maximum applied load/ $K_{\rm o}$.

Where K_0 can be determined from the Polar Graph to the right.

- (1) The Dynamic Load Capacity is based on a rated travel life of 2 million inches. The actual Dynamic Load Capacity can be affected by the orientation of the bearing or the direction of the applied load. For dynamic load correction factors see polar graphs below.
- For the maximum length of all 60 Case LinearRace Support Rail Assemblies without 60 Case LinearRace Joints see maximum length table on page 57. 60 Case LinearRace Support Rail Assemblies are available with 60 Case LinearRace joints for unlimited travel lengths.
- ⁽³⁾ For part number description and specifications see page 56 and 57.
 Note: For additional technical data, see Engineering Support Appendix.

	Standard Without Holes	Standard With PreDrilled Holes	Assembly With Solid 60 Case LinearRace	Standard Single Piece Length ⁽²⁾ in	Maximum Single Piece Length ⁽²⁾ in
Γ	LSR	LSR-PD	-	48	96
Γ	SR	SR-PD	SRA	24	72

Polar Graphs

The actual Dynamic Load Capacity of a Ball Bushing bearing is determined by the orientation of the bearing or direction of the applied load. The load Correction Factor K_0 is found by knowing the direction of the applied load relative to the orientation of the bearings ball tracks and referring to the polar graph. To determine the actual Dynamic Load Capacity, multiply the proper correction factor by the Dynamic Load Capacity listed in the product table on the previous page.

Cam-Actuated Part Transfer Mechanism for Multiple-Transfer Press

Objective

Improve production rate and increase the service life of a transfer table mechanism.

Solution

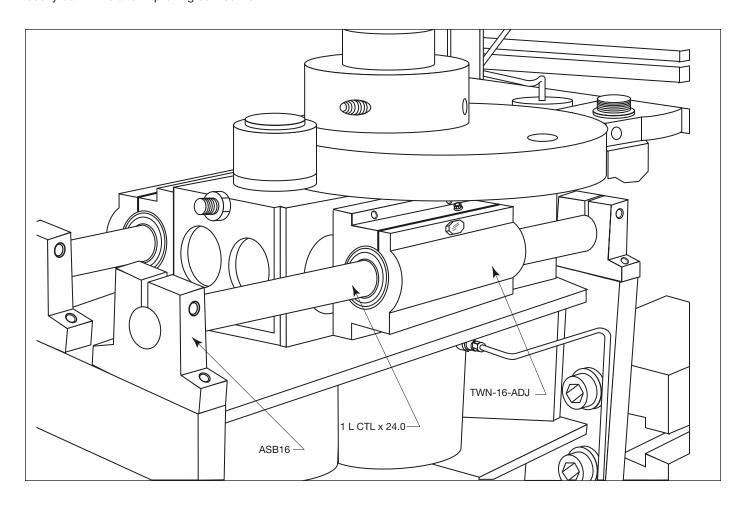

Replace the conventional linear bearings with Adjustable Super Ball Bushing* Twin Pillow Blocks. Bearing service life increased to 5 years.

Products Specified

- 2 TWN16-ADJ (Super Ball Bushing Twin Pillow Blocks)
- 4 ASB16 (60 Case* LinearRace* End Support Blocks)
- 2 1 L CTL x 24.00 in (60 Case LinearRace)

Benefits

The table achieved maximum cycle efficiency by reducing costly downtime and improving service life.

Precision Steel Ball Bushing Bearing Products

Thomson Precision Steel Ball Bushing* Bearing Products offer:

- a coefficient of friction as low as .001.
 When replacing high friction plain bearings, Precision Steel Ball Bushing bearings dramatically improve machine productivity and efficiency.
- all-steel construction, for maximum system rigidity.
- two accuracy classes allowing for immediate improvements in system positioning and repeatability.
- availability in fourteen bore sizes and nine configurations.

- the RoundRail* Advantage which minimizes installation time and cost.
- steady state travel speeds up to 10 ft/s and accelerations to 450 ft/s2 without the use of derating factors.
- an operating temperature up to 600° F.
- availability in a self-aligning pillow block housing for ease of installation and use.
- worldwide availability from over 1800 authorized distributors.

Precision Steel Ball Bushing Bearings

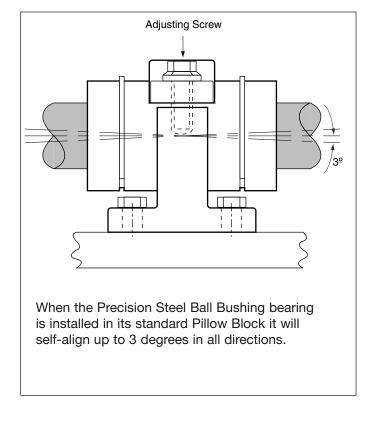

The basis for the performance of all Precision Steel Ball Bushing* bearings is a simple but ingenious system of ball recirculation that permits almost frictionless, unlimited travel.

Replace High Friction Plain Bearings

Plain bearings cause friction, stick-slip, binding and chatter. The Precision Steel Ball Bushing bearing's patented ball recirculation virtually eliminates wear and provides a constant coefficient of friction as low as .001. This dramatic reduction in friction allows the designer to use smaller less expensive drive motors, ball screws, belts, linkages and gears.

Lasting Precision Alignment

High friction plain bearings cause wear resulting in a loss in system alignment and repeatability. Each Precision Steel Ball Bushing bearing is manufactured with high quality bearing steel that is hardened and precision ground. The rolling elements of each Ball Bushing bearing are precision ground bearing balls that recirculate freely into and out of the load zone. The balls are guided through their recirculation path by a steel retainer and hardened sleeve. The inherent non-wear characteristics of each Precision Steel Ball Bushing bearing assures maximum system accuracy and repeatability.

High Travel Speeds

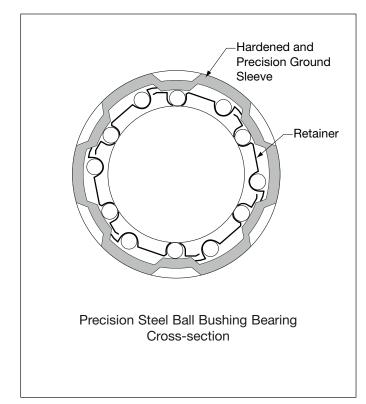

Precision Steel Ball Bushing can operate at travel rates as high as 10 ft/s and accelerations as high as 450 ft/s2. When replacing inefficient v-way or flat-way systems, this travel rate capability provides immediate improvements in machine efficiency and productivity.

Ease of Installation

The Precision Steel Ball Bushing bearing can be retained in a housing, internally or externally. The retaining ring groove on the outside diameter allows the bearing to be captured and retained by an external retaining ring. If internal retention is required, the Ball Bushing bearing can be installed in a housing and held in place with an internal retaining ring.

Protection from Contamination

Precision Steel Ball Bushing bearings most popular sizes are available with double acting integral wipers that keep out contamination, retain lubrication and maximize travel life.

Precision Steel Ball Bushing Bearing Products

Table of Contents

Precision Steel Ball Bushing* Bearing Products	
or End Supported Applications	70

Precision Steel Ball Bushing bearing closed type products have been designed for use in end supported applications, where spanning or bridging a gap is required. End supported products are available in a variety of configurations and sizes. For a complete overview of each Precision Steel Ball Bushing bearing end supported product, simply turn to page 70. For complete product specifications see the pages referenced below.

Precision Steel Ball Bushing Bearings and Pillow Blocks for End Supported Applications

Precision Steel Ball Bushing Bearings (Closed type) Features:

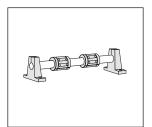

- Coefficient of friction as low as .001.
- Load capacity range from 19 to 5,000 lbf.
- High operating temperature capability.
- Available in sizes 1/4 to 4 inch bore diameter.
- Can be mounted in a custom housing.
- Travel speeds up to 10 ft/s.

- Available in corrosion resistant stainless steel for diameters up to 1 inch.
- All steel construction for increased rigidity.
- Sizes 1/2, 3/4 and 1 inch available with integral, double acting wipers.

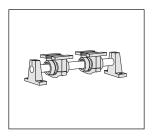

Extra Precision Steel Ball Bushing Bearings (Closed type)

- Increased precision for high accuracy positioning and repeatability
- Coefficient of friction as low as .001.
- Load capacity range from 19 to 5,000 lbf.
- High operating temperature capability.
- Available in sizes 1/4 to 4 inch bore diameter.
- Can be mounted in a custom housing.
- Travel speeds up to 10 ft/s.
- Available in corrosion resistant stainless steel for diameters up to 1 inch.
- All steel construction for increased rigidity.
- Sizes 1/2, 3/4 and 1 inch available with integral, double acting wipers.

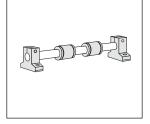

Adjustable Precision Steel Ball Bushing Bearings (Closed Type) Features:

- Adjustment capability provides minimum 60 Case* LinearRace* shaft and bearing clearance for improvements in positioning accuracy and repeatability.
- Coefficient of friction as low as .001.
- Load capacity range from 85 to 5,000 lbf.
- High operating temperature capability.
- Available in sizes 1/2 to 4 inch bore diameter.
- Can be mounted in a custom housing.
- Travel speeds up to 10 ft/s.
- All steel construction for increased rigidity.
- Available in corrosion resistant stainless steel for diameters up to 1 inch.

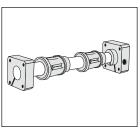

Precision Steel Ball Bushing Pillow Blocks (Closed and Adjustable Type) Features:

- Coefficient of friction as low as .001.
- Load capacity range from 85 to 1,100 lbf.
- High operating temperature capability.
- Available in sizes 1/2 to 2 inch bore diameter.
- Self-aligning for easy installation.
- Travel speeds up to 10 ft/s.
- Pillow Blocks are available with corrosion resistant stainless steel Ball Bushing bearings up to 1 inch.
- Easily mounted and secured with four mounting bolts.
- All metal construction for increased rigidity.
- Available with integral, double acting seals.
- Adjustment capability provides minimum 60 Case LinearRace and bearing clearance for improvements in positioning accuracy and repeatability.

Miniature Instrument Ball Bushing Bearings Features:

- Available in sizes 1/8, 3/16 and 1/4 inch bore diameter.
- Available with a matched 60 Case LinearRace
- Coefficient of friction as low as .001.
- Compact size for low inertia and weight.
- Precision bearing balls, sleeve and 60 Case LinearRace manufactured of corrosion resistant stainless steel.
- Load Capacity range between 7 and 19 lbf.

Die Set Ball Bushing Bearings Features:

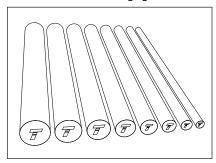

- Available in sizes 1, 11/4, 11/2 and 2 inch bore diameter.
- Load Capacity range between 350 and 1,100 lbf.
- All steel construction for maximum rigidity.
- Travel speeds up to 10 ft/s.

- Easily mounted by simply bolting toe clamps in place.
- Can be mounted perpendicular to mounting surface.
- High operating temperature capability.
- Coefficient of friction as low as .001.

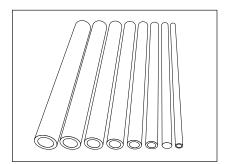

60 Case LinearRace Shafting for End Supported Applications

Solid 60 Case* LinearRace* Shafting Features:

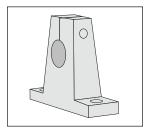

- Diameter range between 3/16 and
- Roundness 80 millionths of an inch.
- Case hardness 60 HRC minimum.
- Surface finish 12 Ra microinch. Available in corrosion resistant
- 440C stainless steel (50 HRC minimum).
- Available with PrePlate* chrome
- Standard straightness is .001 inch per foot cumulative (.002 TIR) with special straightness at .0005 inch per foot cumulative (.001 TIR) available.

60 Case Tubular Lite* LinearRace Shafting Features:

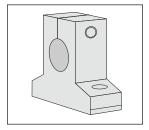

- Hollow inner diameter reduces weight and inertia.
- Diameter range between 3/4 and 4 inch.
- Roundness 80 millionths of an inch.
- Case hardness 58 HRC minimum.
- Surface finish 12 Ra microinch.
- Available with Preplate chrome option.
- Standard straightness is .001 inch per foot cumulative (.002 TIR) with special straightness at .0005 inch per foot cumulative (.001 TIR) available.

60 Case LinearRace Supports For End Supported Applications

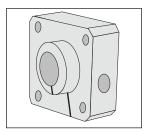

SB 60 Case LinearRace End Support Block **Features:**

- Size range between 1/4 and 2 inch.
- Easily secured with two mounting bolts.
- Malleable iron alloy for sizes 1/2 to 2 inch diameter.
- Protected by corrosion resistant coating.
- · Light weight, high strength aluminum alloy construction for sizes 1/4 and 3/8 inch.

ASB Low Profile 60 Case LinearRace End Support Block Features:

- Size range between 1/4 and 11/2 inch.
- Low profile design.
- Easily secured with two mounting bolts.
- Protected by corrosion resistant anodized coating.
- · Light weight, high strength aluminum alloy construction.

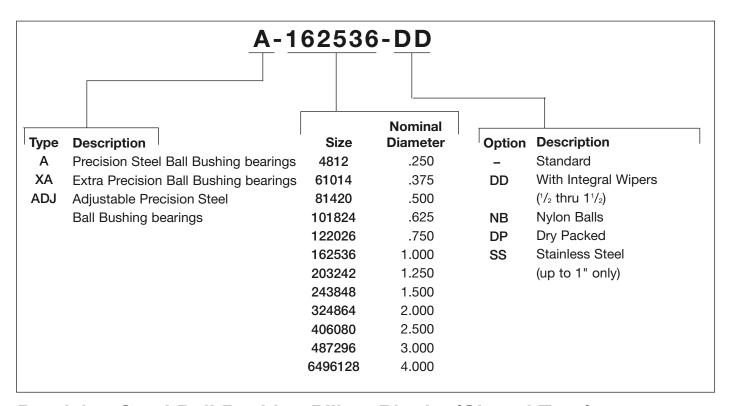

FSB Flanged 60 Case LinearRace End Support Block Features:

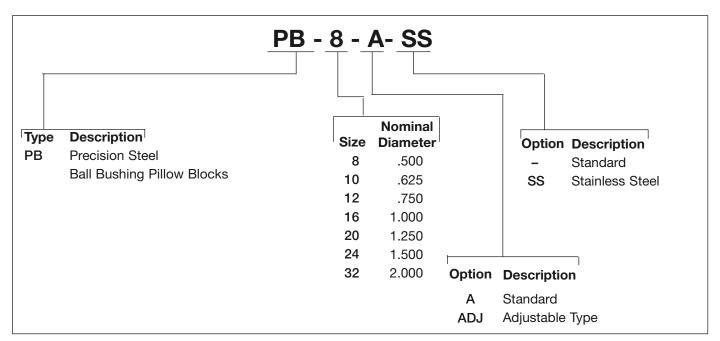

- Available in 1/2, 3/4, 1 and 11/4 inch diameters.
- Flanged mounting surface for easy assembly.
- Easily secured with four mounting bolts.
- Designed specifically for use with Super Smart Flanged Pillow Blocks
- Protected by corrosion resistant coating.
- · Light weight, high strength aluminum alloy construction.

Load/Life Graph (Lines indicate limiting load for given Ball Bushing bearing)

[‡] P=Preload, C=Clearance

Determining Ball Bushing Bearing Size

To determine the proper Ball Bushing bearing size enter the chart with the maximum load of the most heavily loaded bearing and the required travel life. Mark where the two lines intersect. All Ball Bushing bearing sizes that pass through or above and to the right of this point may be suitable for this application.

Note: For the purpose of using this chart.

Load on most heavily loaded bearing = maximum applied load/ $K_{\rm o}$.

Where K₀ can be determined from the Polar Graph to the right.

Page 74

⁽¹⁾ The Dynamic Load Capacity is based on a rated travel life of 2 million inches. The actual Dynamic Load Capacity can be affected by the orientation of the bearing or the direction of the applied load. For dynamic load correction factors see polar graphs below.

Polar Graphs

The actual Dynamic Load Capacity of a Ball Bushing bearing is determined by the orientation of the bearing or direction of the applied load. The load Correction Factor K₀ is found by knowing the direction of the applied load relative to the orientation of the bearings ball tracks and referring to the polar graph. To determine the actual Dynamic Load Capacity, multiply the proper correction factor by the Dynamic Load Capacity listed in the product table on the previous page.

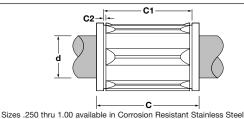

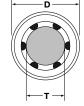

Por part number description and specifications see page 72 and 73.

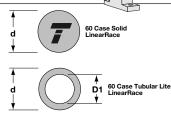

Note: Precision Steel Ball Bushing bearings are available in corrosion resistant stainless steel in diameters up to 1 inch. Dynamic load ratings are reduced by 30% when using stainless steel Ball Bushing bearings. See Engineering Support Appendix page 136. For additional technical data, see Engineering Support Appendix.

Load/Life Graph (Lines indicate limiting load for given Ball Bushing bearing)

Determining Ball Bushing Bearing Size

To determine the proper Ball Bushing bearing size enter the chart with the maximum load of the most heavily loaded bearing and the required travel life. Mark where the two lines intersect. All Ball Bushing bearing sizes that pass through or above and to the right of this point may be suitable for this application.

Note: For the purpose of using this chart.

Load on most heavily loaded bearing = maximum applied load/ \mathbf{K}_{o} .

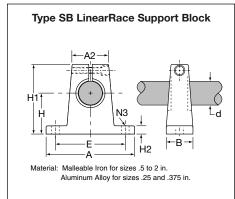

Where K_0 can be determined from the Polar Graph to the right.

The Dynamic Load Capacity is based on a rated travel life of 2 million inches. The actual Dynamic Load Capacity can be affected by the orientation of the bearing or the direction of the applied load. For dynamic load correction factors see polar graphs below.

Polar Graphs

The actual Dynamic Load Capacity of a Ball Bushing bearing is determined by the orientation of the bearing or direction of the applied load. The load Correction Factor K₀ is found by knowing the direction of the applied load relative to the orientation of the bearings ball tracks and referring to the polar graph. To determine the actual Dynamic Load Capacity, multiply the proper correction factor by the Dynamic Load Capacity listed in the product table on the previous page.

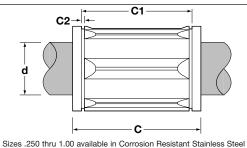

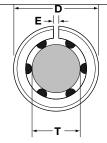

⁽²⁾ For part number description and specifications see page 72 and 73.

Note: Precision Steel Ball Bushing bearings are available in corrosion resistant stainless steel in diameters up to 1 inch. Dynamic load ratings are reduced by 30% when using stainless steel Ball Bushing bearings. See Engineering Support Appendix page 136. For additional technical data, see Engineering Support Appendix.

Load/Life Graph (Lines indicate limiting load for given Ball Bushing bearing)

Determining Ball Bushing Bearing Size

To determine the proper Ball Bushing bearing size enter the chart with the maximum load of the most heavily loaded bearing and the required travel life. Mark where the two lines intersect. All Ball Bushing bearing sizes that pass through or above and to the right of this point may be suitable for this application.

Note: For the purpose of using this chart.

Load on most heavily loaded bearing = maximum applied

Where $K_{\scriptscriptstyle 0}$ can be determined from the Polar Graph to the right.

Load/Life Graph (Lines indicate limiting load for given Ball Bushing* bearing)

Determining Ball Bushing Bearing Size

To determine the proper Ball Bushing bearing size enter the chart with the maximum load of the most heavily loaded bearing and the required travel life. Mark where the two lines intersect. All Ball Bushing bearing sizes that pass through or above and to the right of this point may be suitable for this application.

Note: For the purpose of using this chart. Load on most heavily loaded bearing = maximum applied load/K_{0*}

Where K₀ can be determined from the Polar Graph to the right.

The actual Dynamic Load Capacity can be affected by the orientation of the bearing or the direction of the applied load. For dynamic load correction factors see polar graphs below.

Note: For additional technical data, see Engineering Support Appendix.

Polar Graphs

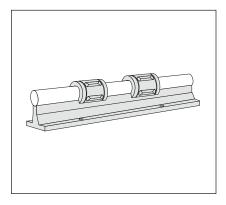

The actual Dynamic Load Capacity of a Ball Bushing bearing is determined by the orientation of the bearing or direction of the applied load. The load Correction Factor K_0 is found by knowing the direction of the applied load relative to the orientation of the bearings ball tracks and referring to the polar graph. To determine the actual Dynamic Load Capacity, multiply the proper correction factor by the Dynamic Load Capacity listed in the product table on the previous page.

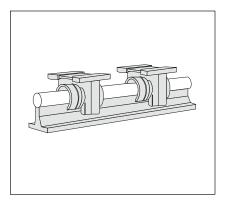

⁽¹⁾ The Dynamic Load Capacity is based on a rated travel life of 2 million inches.

Precision Steel Ball Bushing Bearings and Pillow Blocks(Open Type) for Continuously Supported Applications

Precision Steel Ball Bushing Bearings (Open type) Features:

- Coefficient of friction as low as .001.
- Load Capacity range from 60 to 3,800 lb_f.
- Can be mounted in a custom housing.
- Available in sizes ½ to 4 inch diameter.
- All steel construction for maximum rigidity.
- Can be adjusted to remove clearance between the Ball Bushing bearing and 60 Case* LinearRace*.
- Available in corrosion resistant stainless steel in sizes up to 1 inch diameter.
- Travel speeds up to 10 ft/s.
- High operating temperature capability.

Precision Steel Ball Bushing Pillow Blocks (Open Type) Features:

- Self-aligning for easy installation.
- Easily secured to table surface with four mounting bolts.
- Coefficient of friction as low as .001.
- Load capacity range from 60 to 860 lb_f.
- Available in sizes ½ to 2 inch diameter.
- Available with seals at both ends.
- All steel construction for maximum rigidity.
- Can be adjusted to remove clearance between the Ball Bushing bearing and 60 Case LinearRace.
- Available with corrosion resistant stainless steel Ball Bushing bearing in sizes up to 1 inch diameter.
- Travel speeds up to 10 ft/s.

60 Case LinearRace (PreDrilled) for Continuously Supported Applications

60 Case* Solid LinearRace* with Mounting Holes Features:

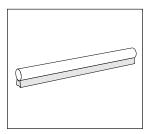

- Radial drilled and tapped holes ready for immediate use with standard hole spacing to match standard 60 Case LinearRace support rails.
- Diameter range between ½ and 4 inch.
- Surface finish 12 R_a microinch.
- Hardness 60 HRC minimum.
- Roundness 80 millionths of an inch.
- Available in corrosion resistant 440C stainless steel (50 HRC minimum).
- Available with Preplate chrome option.
- Standard straightness .001 inch per foot cumulative (.002 TIR) with special straightness at .0005 inch per foot cumulative (.001 TIR) available.

60 Case Tubular Lite LinearRace with Mounting Holes Features:

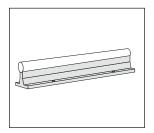

- Hollow design reduces weight and inertia.
- Radial drilled and tapped holes ready for immediate use.
- Standard hole spacing to match standard 60 Case LinearRace support rails.
- Diameter range between 1½ and 4 inch.
- Roundness 80 millionths of an inch.
- Case hardness 58 HRC minimum.
- Surface finish 12 R_a microinch.
- Available with Preplate chrome option.
- Standard straightness .001 inch per foot cumulative (.002 TIR) with special straightness at .0005 inch per foot cumulative (.001 TIR) available.

60 Case LinearRace Support Rails and Assemblies for Continuously Supported Applications

LSR Low Profile 60 Case LinearRace Support Rail Features:

- Diameter range between ½ and 4 inch.
- Available with standard mounting holes for immediate use.
- Available without mounting holes for custom hole spacing.
- Low Profile design.
- · Unlimited travel lengths.

SR 60 Case LinearRace Support Rail SRA 60 Case LinearRace Support Rail Assembly Features:

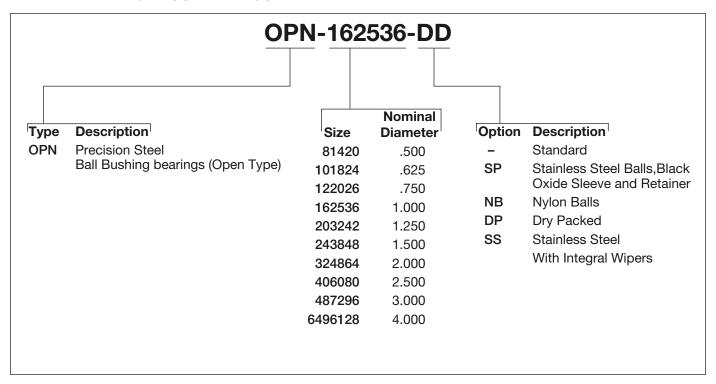

- Diameter range between ½ and 2 inch.
- Available with standard mounting holes for immediate use.
- Available without mounting holes for customized hole spacing.
- Available as a pre-engineered, ready to install assembly.
- Light weight, high strength aluminum alloy rail.
- Unlimited travel lengths.

- (1) The Dynamic Load Capacity is based on a rated travel life of 2 million inches. The actual Dynamic Load Capacity can be affected by the orientation of the bearing or the direction of the applied load. For dynamic load correction factors see polar graphs below.
- For the maximum length of all 60 Case* LinearRace* Support Rail Assemblies without 60 Case LinearRace Joints see maximum length table on page 89. 60 Case LinearRace Support Rail Assemblies are available with 60 Case LinearRace joints for unlimited travel lengths.
- ⁽³⁾ For part number description and specifications see page 88 and 89.

 Note: Precision Steel Ball Bushing* bearings are available in corrosion resistant stainless steel in diameters up to 1 inch. Dynamic load ratings are reduced by 30% when using stainless steel Ball Bushing bearings. See Engineering Support Appendix page 136. For additional technical data, see Engineering Support Appendix.

Polar Graphs

The actual Dynamic Load Capacity of a Ball Bushing bearing is determined by the orientation of the bearing or direction of the applied load. The load Correction Factor K₀ is found by knowing the direction of the applied load relative to the orientation of the bearings ball tracks and referring to the polar graph. To determine the actual Dynamic Load Capacity, multiply the proper correction factor by the Dynamic Load Capacity listed in the product table on the previous page.

Wire Straightening / Feeding Mechanism

Objective

Redesign a wire straightening/feeding mechanism for a wire drawing machine that improves cycle time and minimizes downtime.

Solution

Combine the performance advantages of the Precision Steel Ball Bushing* bearing with the operating efficiency of Thomson ball screws.

Products Specified

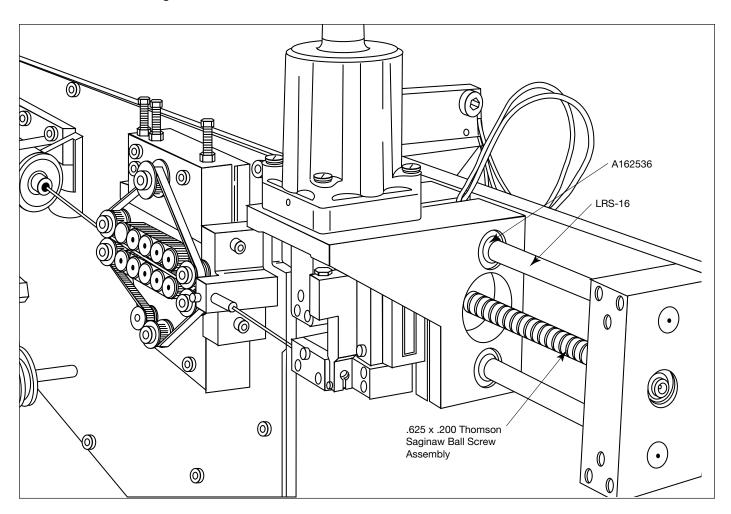

4 - A162536 (Precision Steel Ball Bushing bearings)

2 - 1 S CTL (60 Case* LinearRace*)

1 - .625 x .200 (Thomson ball screw assembly)

Benefits

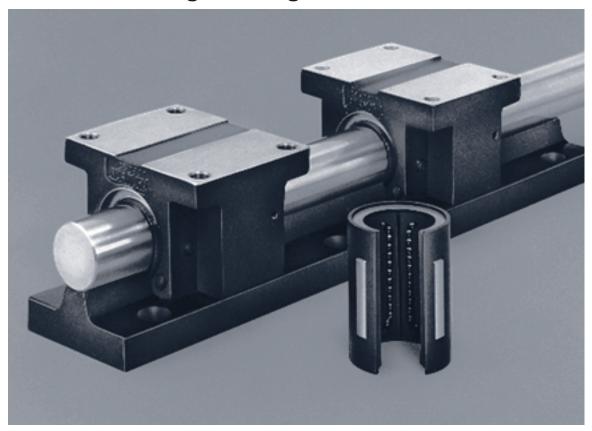

By replacing high friction plain bearings with Precision Steel Ball Bushing bearings, service life increased from six months to four years. This significantly reduced downtime and maintenance requirements and provided increased productivity with substantial cost savings.

XR Ball Bushing Bearing Products

XR Ball Bushing* Bearing Products offer:

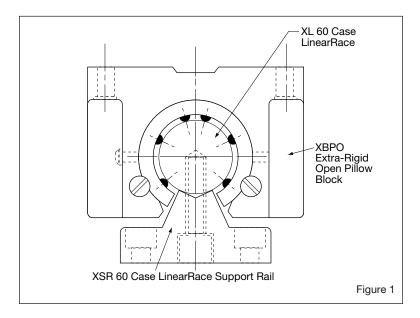

- five times the load capacity or 125 times the travel life of conventional linear bearings. This dramatic increase in travel life reduces downtime and maximizes productivity.
- three times the rigidity of conventional linear bearings. This increase in stiffness provides immediate improvements in machine positioning accuracy and repeatability.
- the RoundRail* Advantage combined with travel speeds up to 5 ft/s. Derating factors commonly found in linear guide products are eliminated.

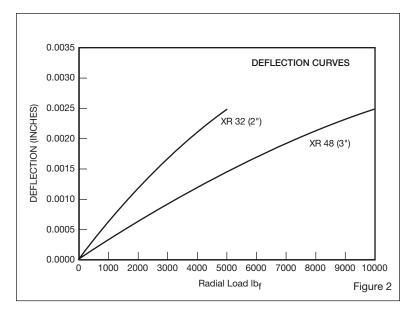

- ease of maintenance. When normal maintenance requires bearing replacement, XR Ball Bushing bearings can be quickly and cost-effectively replaced without scrapping the entire system – another shortcoming of some linear guides.
- double acting seals at both ends that keep out contamination and retain lubrication.
- lasting precision alignment by combining the non-wear characteristics of the XR Ball Bushing bearing with a rigid ductile iron pillow block.
- high accelerations and operating speeds without a dramatic increase in the power consumption commonly seen with high friction v-way and flat-way systems.
- available in three sizes from over 1,800 authorized distributors worldwide.

XR Ball Bushing Bearing Products

XR Ball Bushing* bearing products provide five times the load capacity or 125 times the travel life and three times the rigidity of conventional linear bearings. These improvements are centered around four technologically advanced components, the XR Ball Bushing bearing, the XPBO Ball Bushing pillow block, the XL 60 Case* LinearRace* (shaft) and the XSR 60 Case LinearRace support rail.

XR Ball Bushing Bearing

The dramatic increase in load capacity and/or travel life is provided by the XR Ball Bushing bearing's advanced plate design. Each ball conforming bearing plate is precision ground providing smooth and virtually friction free linear movement. The bearing plate length has also been maximized to increase the number of rolling elements in the load carrying zone. The position of each XR bearing plate helps to maximize the load capacity in both pull-off and down loading conditions.

XPBO Ball Bushing Pillow Block

Each XR Ball Bushing bearing can be housed in a rigid ductile iron pillow block (Figure 1). The XPBO pillow block provides the stiffness required in high load applications (Figure 2). Each XPBO is equipped with four mounting holes for easy assembly to the table surface.

XL 60 Case LinearRace

Available factory mounted to XSR 60 Case LinearRace support rail is a hardened and precision ground 60 Case LinearRace (Figure 1). Each 60 Case LinearRace is ground to a surface finish less than 10 Ra microinch and is straight to .001 inch per foot cumulative. Roundness of each 60 Case LinearRace is controlled through proprietary techniques that results in a roundness of 80 millionths of an inch. Each XL 60 Case LinearRace is held to these world class quality standard to assure maximum system performance and travel life.

XSR 60 Case LinearRace Support Rails

Rigidity always starts by continuously supporting the 60 Case LinearRace and bearing system (Figure 1). The large ductile iron alloy cross-section of the XSR provides maximum rigidity and stiffness (Figure 2). The increased number of standard 60 Case LinearRace mounting holes add further stiffness and stability to the system.

The RoundRail Advantage

The RoundRail Advantage is the inherent ability of an XR Ball Bushing bearing system to accommodate torsional misalignment (caused by inaccuracies in carriage or base machining or by machine deflection) with little increase in stress to bearing components. Installation time and cost are minimized and system performance is maximized.

Page 96

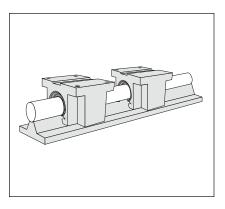

XR Ball Bushing Bearings

XR Ball Bushing Bearing Products

for Continuously Supported Applications

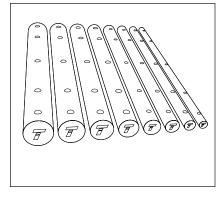

XR Ball Bushing* Bearings Features:

- Available in sizes 2 and 3 inch bore diameter.
- Load capacity range from 4,500 to 10,000 lb_f.
- Pull of load capacity range between 2,100 to 8,000 lb_f.
- Can be mounted in a custom housing.
- Travel speeds up to 5 ft/s.
- System accelerations up to 160 ft/s².

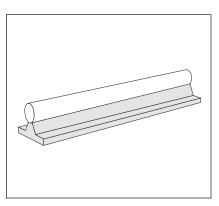

XPBO Ball Bushing Pillow Blocks Features:

- Available in 2 and 3 inch diameter sizes.
- Load capacity range from 4,500 to 10,000 lb_f.
- Pull of load capacity range between 2,100 to 4,500 lb_f.
- Easily secured to table or carriage surface with four mounting bolts.
- Travel speeds up to 5 ft/s.
- System accelerations up to 160 ft/s².
- When used with XL 60 Case* LinearRace* internal clearance is minimized.
- Integral double acting seals at both ends.

XL 60 Case LinearRace Features:

- Case hardness to 60 HRC minimum.
- Surface finish is 8 R_a microinch for 2 and 3 inch diameter and 10 R_a microinch for 4 inch diameter.
- Roundness 80 millionths of an inch.
- Straightness of .0005 inch per foot (.001 TIR) cumulative.
- Available with standard radial drilled and tapped holes.
- Minimum depth of hardness is .100
 inch

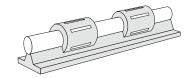

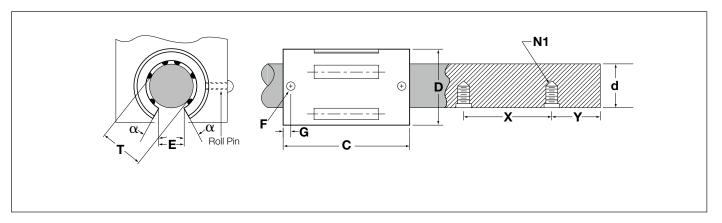

XSR 60 Case LinearRace Support Rails Features:

- All ductile iron, heavy duty design and construction.
- Available in 2 and 3 inch diameter sizes.
- Equipped with drilled thru and counterbored base mounting holes.
- Can be pre-assembled with a 60 Case LinearRace for quick and easy installation.
- Precision ground surfaces for 60 Case LinearRace and base mounting.
- Reference edge for ease of installation.

Determining Ball Bushing Bearing Size

To determine the proper Ball Bushing bearing size enter the chart with the maximum load of the most heavily loaded bearing and the required travel life. Mark where the two lines intersect. All Ball Bushing bearing sizes that pass through or above and to the right of this point may be suitable for this application.

Note: For the purpose of using this chart. Load on most heavily loaded bearing = maximum applied load/ $K_{\rm o}$.

Where K_0 can be determined from the Polar Graph to the right.

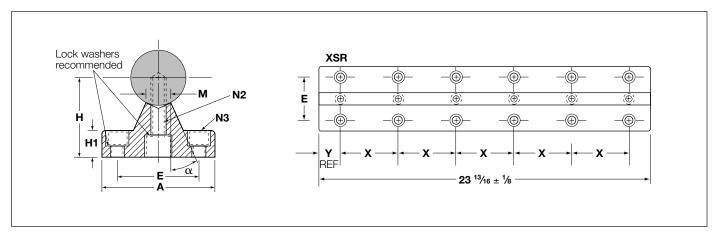

Page 98

⁽²⁾ Retention hole does not go through bearing retainer.

⁽³⁾ The Dynamic Load Capacity is based on a rated travel life of 2 million inches. The actual Dynamic Load Capacity can be affected by the orientation of the bearing or the direction of the applied load. For dynamic load correction factors see polar graphs opposite.

The actual Dynamic Load Capacity of a Ball Bushing bearing is determined by the orientation of the bearing or direction of the applied load. The load Correction Factor K₀ is found by knowing the direction of the applied load relative to the orientation of the bearings ball tracks and referring to the polar graph. To determine the actual Dynamic Load Capacity, multiply the proper correction factor by the Dynamic Load Capacity listed in the product table on the previous page.

180

X-Y-Z System

Objective

Build a rigid X-Y-Z System designed to perform welding and flame cutting tasks.

Solution

Extra Rigid Ball Bushing bearings will be used on the X-axis to minimize deflection of the cantilevered Y-axis. Self-aligning Super Smart Ball Bushing* bearings are used on the Y and Z axis to simplify the assembly.

Products Specified

X-axis

- 4 XR-32-OPN (XR Ball Bushing bearing)
- 2 XSRA-32 x 108 in (60 Case* LinearRace* Support Rail Assembly)

Y-axis

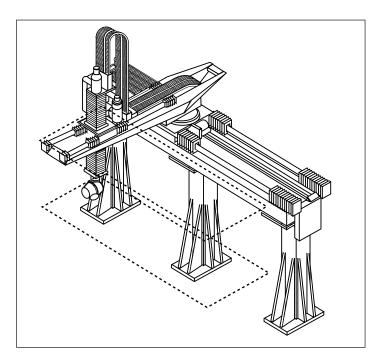

- 4 SSU-12-OPN (Super Smart Ball Bushing bearing [Open Type])
- 2 LSR-12-PD x 48 in (Low Profile 60 Case LinearRace Support Rail)
- 2 3/4 L PD CTL x 48 in (60 Case LinearRace)

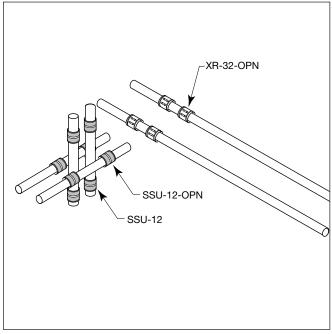

Z-axis

- 4 SSU-12 (Super Smart Ball Bushing bearing)
- 2 3/4 L CTL x 36 in (60 Case LinearRace)

Benefits

The high load capacity, rigidity and RoundRail* Advantage of the Super Smart and XR Ball Bushing bearings provided an easy to assemble system with a repeatability of ±.005 in.

RoundWay Linear Roller Bearings

Thomson RoundWay* Linear Roller Bearings offer:

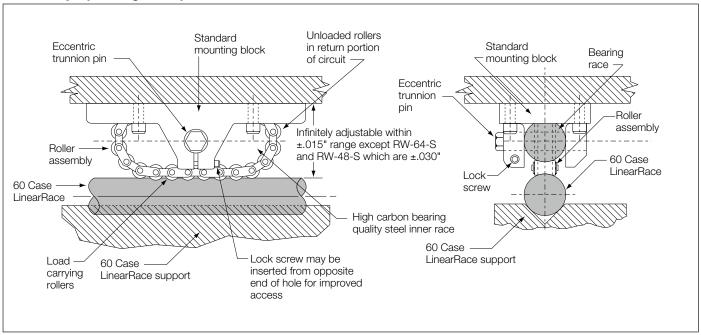

- up to twenty times the load capacity of conventional linear ball bearings. This dramatic increase allows for more compact machine designs with a reduction in hardware costs.
- a rigid design that provides high accuracy while tolerating the high shock loads common to machine tool applications.
- a coefficient of friction as low as .005.
 When replacing v-ways or flat-ways,
 RoundWay linear roller bearings allow for the use of smaller less expensive drives, motors, belts, gears and ball screws.
- a self-aligning capability that reduces installation time and cost.
- an eccentric trunnion pin that adjusts bearing height to compensate for minor inaccuracies in mounting base flatness or machining accuracy. Installation is quicker and easier than old style, conventional way systems.

- availability of an integral wiper that protects against contamination while retaining lubrication.
- interchangeable components for quick, cost-effective machine maintenance. There is no need to scrap the entire way system, a problem with some linear guide products.
- the RoundRail* Advantage combined with the self aligning feature, eliminates the need for derating factors commonly seen with linear guides.
- availability from over 1800 distributors worldwide.

RoundWay Linear Roller Bearings

RoundWay Operating Principle

Thomson invented the RoundWay* Linear roller bearing for use in high load, heavy duty applications. Each RoundWay bearing combines the high load capacity of hardened and ground steel recirculating rollers with a rigid malleable iron pillow block providing extremely high load capacity with smooth linear travel. The RoundWay linear roller bearing comes in both a single and dual version. A single RoundWay linear roller bearing does not resist side loads and is therefore always used in conjunction with a dual version, unless used in a configuration as shown in Figures 2, 3 and 4 on page 105.

Each RoundWay linear roller bearing is designed for use on 60 Case LinearRace. The 60 Case* LinearRace* shaft an be continuously supported using type LSR, SR, FLSR or XSR 60 Case LinearRace support rails or intermittently supported using the adjustable Waymount* LinearRace supports type WM.

The RoundWay linear roller bearing consists of four basic parts: the bearing race, the roller assembly, the eccentric trunnion pin and the mounting block. The rolling elements of a RoundWay linear roller bearing are a series of concave rollers interconnected and linked by a chain assembly. As load is applied to the

Page 104

mounting block it is transferred through the bearing race and roller assembly to the supported 60 Case LinearRace. Connecting the mounting block to the RoundWav

bearing and roller assembly is an eccentric trunnion pin that allows the height of the RoundWay linear roller bearing to be adjusted to compensate for variations in the mounting surfaces or the build-up of tolerances between component elements. The eccentric trunnion pin can also be used to preload the RoundWay bearing by eliminating internal bearing clearance. After the eccentric trunnion pin has been adjusted it can be held in place by simply tightening the lock screw.

Self-Aligning

The RoundWay single and dual bearings are designed with a built-in self-aligning capability that absorbs misalignment caused by inaccuracies in carriage or base machining. The RoundWay single bearing has an additional built-in self-aligning capability that allows it to absorb misalignment caused by two slightly out of parallel 60 Case LinearRace ways. This feature is realized when two RoundWay single bearings are mounted on one 60 Case LinearRace and two dual RoundWay bearings are on a parallel 60 Case LinearRace (Figure 1 on page 105).

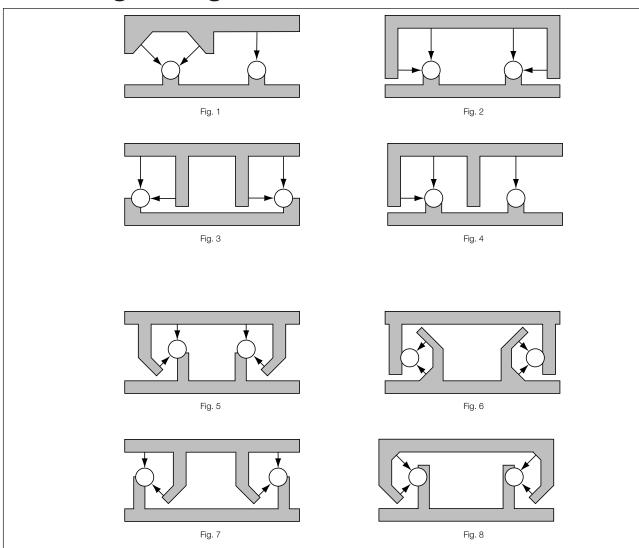

Website: www.thomsonballbushing.com

Roundway

RoundWay Linear Roller Bearing Mounting Configurations

IMPORTANT!

A single RoundWay bearing does not resist side loads. Therefore, dual RoundWay bearings or the equivalent are always used in combination with single units.

RoundWay* Bearing Mounting Arrangements

RoundWay bearings are available in single mounting blocks or dual V-blocks. The basic race and roller assembly can be purchased separately, along with the suitable type of trunnion pin for mounting directly in the carriage or other machine elements (see page 110). When using either type of cantilever mounting trunnion pin, deflection may be experienced under heavy loads.

The above illustrations are a few schematic suggestions for arrangements of RoundWay bearings and 60 Case* LinearRace* ways. The load directions of the bearings are indicated by arrows.

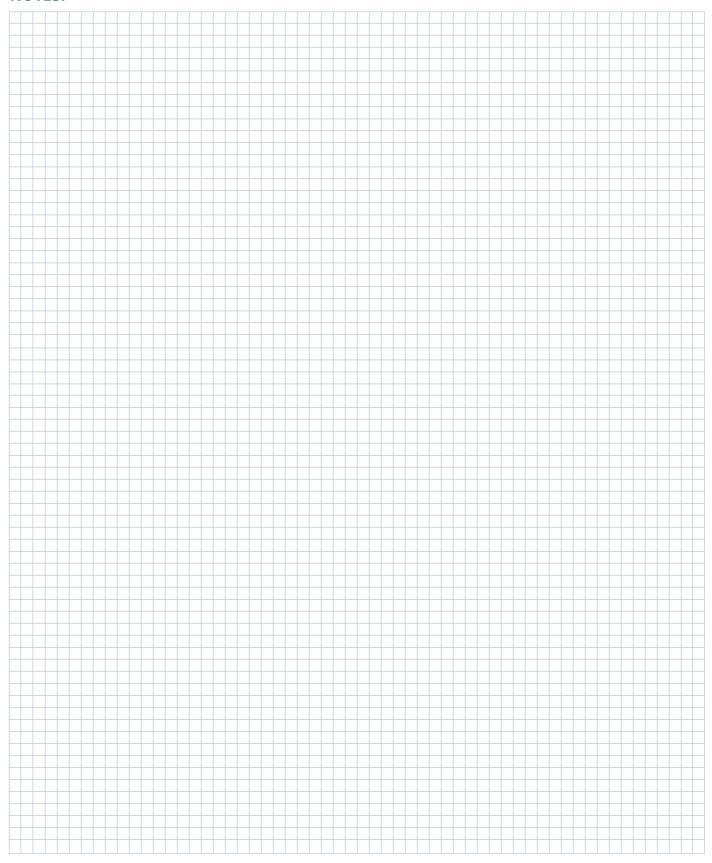

The first group (Figs. 1 through 4) depends on gravity to hold the carriage on the ways.

The second group shows arrangements which will carry loads in any direction. The first two figures (Figs. 5 and 6) are similar to the second two figures (Figs. 7 and 8), except for reverse orientation of horizontal load-carrying bearings.

All schematics on this page can be pre-loaded except Fig. 1. In the Fig. 1 arrangement, the maximum side load permitted is 50% of the applied vertical load on the Dual RoundWay bearing.

NOTES:

Page 106

Roundway

RoundWay Linear Roller Bearings

Table of Contents

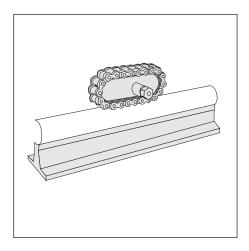

RoundWay Linear Roller bearings have been designed to carry heavy loads in either a continuous or intermittent supported application, where rigidity and stiffness is required. RoundWay Linear Roller bearings are also the proper choice for high speed applications or highly contaminated environments. RoundWay Linear Roller Bearings are available in a variety of configurations and sizes. For a complete overview of each RoundWay type, simply turn to page 108. For specifications see the corresponding pages referenced below.

RoundWay Linear Roller Bearings for Continuously Supported Applications

RoundWay* Linear Roller Bearing Type (Type A,B,C)

- Available in ½ through 3 inch diameters.
- Load capacity range between 970 and 24,000 lb_f.
- Travel speeds up to 100 ft/s.
- Accelerations up to 450 ft/s².
- Can be adjusted to compensate for variations in the mounting surface.
- Self-aligning in all directions.
- Designed to compensate for two 60 Case LinearRace ways that are slightly out of parallel

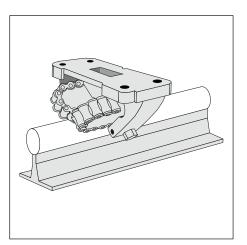

- Can be mounted in a custom housing.
- Available with a two piece seal that retains lubrication while protecting the bearing from the ingress of dirt or contaminants.

RoundWay Linear Roller Bearing (Single Type)

- Available in ½ through 3 inch diameters.
- Load capacity range between 970 and 24,000 lb_f.
- Travel speeds up to 100 ft/s.
- Accelerations up to 450 ft/s².
- Can be adjusted to compensate for variations in the mounting surface.
- Self-aligning in all directions.
- Designed to compensate for two 60 Case LinearRace ways that are slightly out of parallel

- Should always be used in conjunction with RoundWay Dual version.
- Can be mounted in a custom housing.
- Available with a two piece seal that retains lubrication while protecting the bearing from the ingress of dirt or contaminants.
- Easily mounted to carriage with four mounting bolts.

RoundWay Linear Roller Bearing (Dual Type)

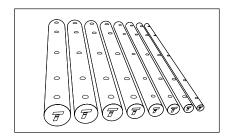

- Available in ½ through 3 inch diameters.
- Load capacity range between 1370 and 35,000 lbf.
- Travel speeds up to 100 ft/s.
- Accelerations up to 450 ft/s2.
- Can be adjusted to compensate for variations in the mounting surface.
- Self-aligning in all directions.
- Available with a two piece seal that retains lubrication while protecting the bearing from the ingress of dirt or contaminants.
- Easily mounted to carriage with four mounting bolts.

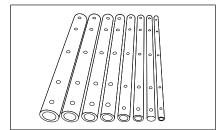

60 Case LinearRace (PreDrilled)

for Continuously Supported Applications

60 Case* Solid LinearRace* with Mounting Holes Features:

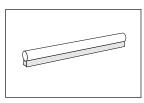

- Radial drilled and tapped holes ready for immediate use with standard hole spacing to match standard 60 Case LinearRace support rails.
- Diameter range between ½ and 4 inch.
- Surface finish 12 R_a microinch.
- Hardness 60 HRC minimum.
- · Roundness 80 millionths of an inch.
- Available in corrosion resistant 440C stainless steel (50 HRC minimum).
- Available with Preplate* chrome option.
- Standard straightness .001 inch per foot cumulative (.002 TIR) with special straightness at .0005 inch per foot cumulative (.001 TIR) available.

60 Case Tubular Lite* LinearRace with Mounting Holes Features:

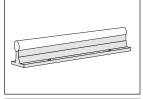

- Hollow design reduces weight and inertia.
- Radial drilled and tapped holes ready for immediate use.
- Standard hole spacing to match standard 60 Case LinearRace support rails.
- Diameter range between 1½ and 4 inch.
- Roundness 80 millionths of an inch.
- Case hardness 58 HRC minimum.
- Surface finish 12 R_a microinch.
- Available with Preplate chrome option.
- Standard straightness .001 inch per foot cumulative (.002 TIR) with special straightness at .0005 inch per foot cumulative (.001 TIR) available.

60 Case LinearRace Support Rails and Assemblies for Continuously Supported Applications

LSR Low Profile 60 Case LinearRace Support Rail Features:

- Diameter range between ½ and 4 inch.
- Available with standard mounting holes for immediate use.
- Available without mounting holes for custom hole spacing.
- Low Profile design.
- Unlimited travel lengths.

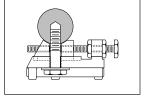

SR/SRA 60 Case LinearRace Support Rail Assembly Features:

- Diameter range between ½ and 2 inch.
- Available with standard mounting holes for immediate use.
- Available without mounting holes for customized hole spacings.
- Available as a pre-engineered, ready to install assembly.
- Light weight, high strength aluminum alloy rail.
- Unlimited travel lengths.

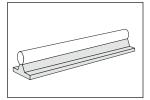

LSRA SmartRail* Assembly Features:

- Diameter range between 5/8 and 11/2 inch.
- Bolt-down-from-the-top mounting.
- Two mounting hole patterns.
- Single piece lengths up to 15 feet long.
- Low profile design.

Waymount* 60 Case LinearRace Support Block Features:

- Available for 60 Case LinearRace diameters ½ through 4 inch.
- Can easily adjust vertical or horizontal position of 60 Case LinearRace.
- Easily secured to base surface.
- Protected with a corrosion resistant coating.
- Designed specifically for use with RoundWay Linear Roller bearings.
- Installation time and cost is minimized.

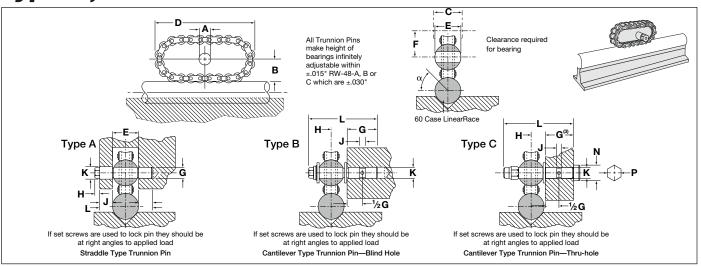

XSR/XSRA 60 Case LinearRace Support Rail and Assembly Features:

- All ductile iron, heavy duty design and construction.
- Equipped with drill thru and counterbored base mounting holes.
- Reference edge for ease of installation.
- Can be pre-assembled with 60 Case LinearRace for quick and easy installation.
- Precision ground surfaces for 60 Case LinearRace and base mounting.
- Available in 2 and 3 inch diameter.

©2003 Danaher Motion. Printed in the U.S.A. The specifications in this publication are believed to be accurate and reliable. However, it is the responsibility of the product user to determine the suitability of Thomson products for a specific application. While defective products will be replaced without charge if promptly returned, no liability is assumed beyond such replacement

⁽¹⁾ Dynamic Load Capacity is based on 10 million inches of travel.

Load/Life Graph (Lines indicate limiting load for given RoundWay bearing)

Determining RoundWay Bearing Size

The primary factors that influence the choice of bearing size are maximum load on a single RoundWay bearing and the required travel life. To determine the proper RoundWay bearing size enter the chart with the maximum load of the most heavily loaded bearing and the required travel life. Mark where the two lines intersect. All RoundWay bearing sizes that pass through or above and to the right of this point may be suitable for this application.

Overhead Carriage for Log-Processing Machine

Objective

Design overhead carriage system using RoundWay linear roller bearings mounted on 60 Case LinearRace ways.

Solution

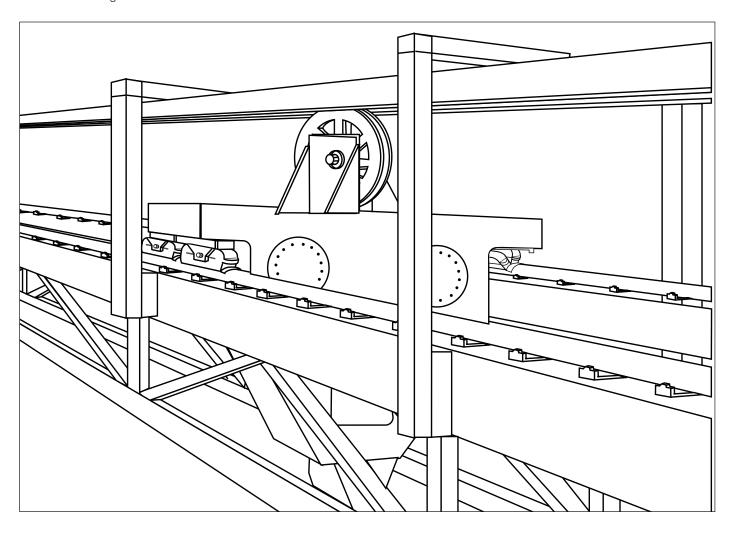

RoundWay linear roller bearings' high load capacity will be used to move heavy logs into and out of the band saws. The carriages shuttle back and forth on 100 foot long 60 Case LinearRace ways until the final cut is made.

Products specified

- 2 RW-32-V (RoundWay Linear Roller bearing Dual Type)
- 2 RW-32-S (RoundWay Linear Roller bearing Single Type)
- 2 2 L PD CTL x 100 ft (60 Case LinearRace)

Benefits

RoundWay linear roller bearings provide operating speeds up to 100 ft/s, optimizing productivity and minimizing cost. The RoundWay bearings' low coefficient of friction allows the use of smaller, less expensive drive motors, belts, linkages and gears. The seal keeps out wood chips and other contaminants and maximizes bearing life.

FluoroNyliner Bushing Bearing

Thomson FluoroNyliner* Bushing Bearing Offers:

- High performance in contaminated, washdown, or submerged environments
- Proprietary, self-lubricating, composite bearing liner TEP 950
- Low friction, ideally suited for linear and rotary motion
- · Precision machined aluminum sleeve
- Excellent performance in high vibration and mechanical shock applications
- Corrosion resistance
- Product availability in industry standard sizes from 0.25" to 2.00"
- Closed, Open, and Self-Aligning configurations
- Load capacities up to 14,000 lbf
- · Integral seals
- Closed, Open, and Flanged Pillow Blocks available in single or twin versions
- Available from over 1800 distributors worldwide

FluoroNyliner* Bushing Bearing Pillow Blocks

For easiest installation, order Pillow Blocks with factory installed FluoroNyliner* Bushing bearings.

THREE PILLOW BLOCK CONFIGURATIONS

CLOSED

CLOSED BEARING PILLOW BLOCKS

- For end supported applications
- Choose twin pillow blocks for twice the load capacity
- Order with seals for heavily contaminated environments
- Available as single or twin pillow blocks

OPEN

OPEN BEARING PILLOW BLOCKS

- For continuously supported applications
- Choose compensated I.D. bearings for non-parallel shafting
- Order with seals for heavily contaminated environments
- Available as single or twin pillow blocks

FLANGED

FLANGED PILLOW BLOCKS WITH CLOSED BEARINGS

- For low profile applications such as packaging equipment
- Choose precision I.D. bearings for precision fit-up
- Available with self-aligning or compensated I.D. bearings
- Available as single or twin pillow blocks

Note: For Pillow Block Seals, or Non-Self-Aligning Bearings see Part Number Matrix at bottom of this page.

[] = Part Number Specific Feature

Attention: Thomson FluoroNyliner* Bushing bearings are precision components. For best results and to preserve the bearing's warranty you must use the specified Thomson 60 Case* LinearRace* shafting.

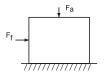

©2003 Danaher Motion. Printed in the U.S.A. The specifications in this publication are believed to be accurate and reliable. However, it is the responsibility of the product user to determine the suitability of Thomson products for a specific application. While defective products will be replaced without charge if promptly returned, no liability is assumed beyond such replacement.

⁽²⁾ All dimensions in inches unless otherwise noted.

Frictional Characteristics:

Static: Tests performed on dry FNYBU-16 bearings indicate that the force required to initiate motion is dependent upon the applied load according to the following equation:

$$F_f = 1.3 + 0.18 F_a$$

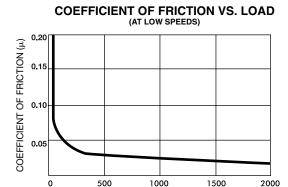

Where:

 F_f = Friction force, static (lbf)

 F_a = Applied force (lbf)

Characteristic	Limit
Liner Temperature Range	-400° F to 550° F (-240° C to 288° C)
Velocity, dry	140 ft/min. Continuous
Velocity, dry	400 ft/min. Intermittent
Velocity, lubricated	400 ft/min. Continuous
Pressure	1500 psi
PV	10,000 psi ft/min

II) Dynamic: The coefficient of friction is dependent upon both the pressure and the velocity. Pressure: Coefficient of friction decreases rapidly with increase in pressure. Velocity: Coefficient of friction increases with an increase in velocity, and quickly stabilizes. For example, at 100 psi, the coefficient of friction is approximately 0.25 for velocities of 100ft/min and higher.

Wear Rates and Life Expectancy:

LOAD (PSI)

Wear rates: The wear rates of a plain bearing are dependent upon a number of variables, including characteristics of the counter-face, velocity, lubrication, load and contamination. Tests conducted on FNYBU-16 bearings operating in the linear mode at approximately 70 ft/min, and at a pressure of approximately 33 psi, demonstrated an average radial wear change of 0.0011 inches, after 80 million inches of travel. This yields the following formula:

$$W_R = 14x(10^{-6})xT$$

Where:

Page 124

W_R = Radial Wear (micro-inches)

T = Travel (inches)

II) Life expectancy: The life expectancy may be calculated from the wear rate. This is normally associated with the allowable radial clearance for a given application. The absolute wear limit is the bearing material thickness, which is 0.028 inches.

Accessories Appendix

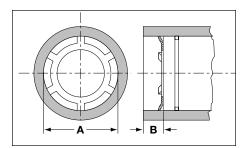

The Accessories Appendix contains the retaining rings, seals and combination bearings used with the products in this catalog.

Table of Contents

Retaining Rings	27
External Seals	28
Integral Seals	29
Resilient Mounts	30

Retaining Rings

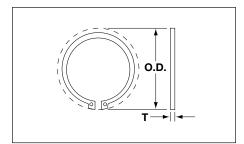

Internal Retaining Rings (Type PR)

Push-in retaining rings, as shown, are for use with Super Smart, Super and Precision Steel Ball Bushing* closed type bearings. Each retaining ring is installed inside the housing bore at each end of the Ball Bushing bearing.

External Seals

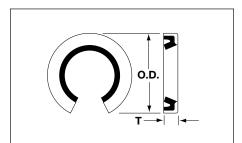

Seals for Fixed Diameter Housings

Double acting seals for Super Smart, Super and Precision Steel closed type Ball Bushing bearings. Standard and stainless versions. Sizes 1¹/2 inch and above use spring fingers to reinforce sealing capability which could add to seal drag.

Seals for Adjustable Housings

Double acting seals for Super Smart, Super and Precision Steel Ball Bushing bearings. Seals have a radial slot through the circumferences to facilitate diameter adjustment. Standard and stainless steel versions.

Seals for Open Type Housings

Double acting seals for Super Smart, Super and Precision Steel Ball Bushing Open Type bearings. Standard and stainless steel versions.

Resilient Mounts

Resilient Ball Bushing Bearing Mounts for Ease of Installation

Used with Precision Steel Ball Bushing bearings Type A and XA. Resilient Ball Bushing bearing mounts are sometimes used when absolute rigidity is not essential and where a slightly larger housing bore can be accommodated. The self-aligning feature of these mounts guarantee uniform load distribution over the entire length of the load carrying balls and compensates for slight errors in housing bores and parallel 60 Case* LinearRace* alignment. The mount consists of a band of resilient material that can be easily mounted to the outside diameter of the Ball Bushing bearing. After it is installed in the housing bore it provides permanent resilient, self-aligning support for the bearing. Resilient mounts consist of one rubber ring, 2 spacers and 2 retaining rings. Ball Bushing bearings must be purchased separately.

Performance Criteria

The following performance criteria relates to the use, installation and specification of Thomson Ball Bushing* bearings. Each performance criteria plays an important role in maximizing system effectiveness and life.

Dynamic Load Capacity

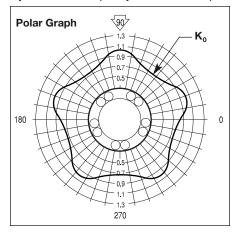

The Dynamic load capacity of a Ball Bushing bearing is determined by the reaction between the rolling elements and the inner and outer race. The rolling elements in a Ball Bushing bearing are a series of hardened and precision ground bearing balls. The inner race is a hardened and precision ground 60 Case LinearRace.

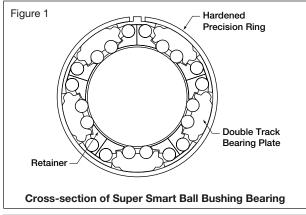

The outer race can be a hardened and precision ground, ball conforming, steel bearing plate or a hardened and precision ground steel bearing sleeve. The dynamic load capacity is also affected by the orientation of the ball tracks, the size of the balls, the shape of the ball conforming groove, the number of balls that are in load contact and more.

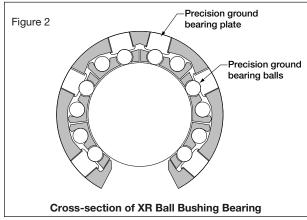

Since the introduction of the Ball Bushing bearing in 1945, Danaher Motion has designed and developed Ball Bushing bearing products that have continuously achieved dramatic increases in dynamic load capacity and life. Our most recent innovation is the Super Smart Ball Bushing bearing which has six times the dynamic load capacity or 216 times greater life than the traditional Ball Bushing bearing.

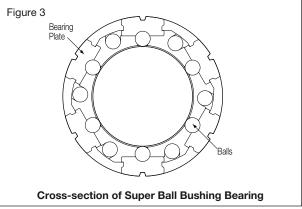

This increase in load capacity was achieved by maximizing the load reaction between the inner and outer races. This break-through in load capacity rivals that of linear guides while still retaining the added benefits of the RoundRail* Advantage.

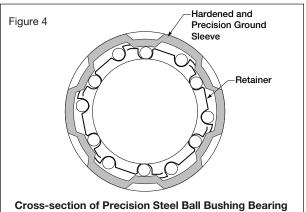

The dynamic load capacity of all Thomson Ball Bushing bearings is based on a L_{10} life of two million inches of travel. The dynamic load capacity can be affected by the orientation of the bearing with respect to the load or the direction of the applied load. A polar graph is included with each product specification to assist you in maximizing the dynamic load capacity as well as the performance of the Ball Bushing bearing. To determine the actual dynamic load capacity enter the polar graph with the applied load direction until it intersects the polar curve. Next, multiply the proper correction factor by the dynamic load capacity listed in each product specification table.

Engineering

Coefficient of Friction

The coefficient of friction of Thomson Ball Bushing* bearings ranges from 0.001 to 0.004. There are two components of the coefficient of friction, the rolling or operating friction and the static or breakaway friction.

Coefficient of Rolling Friction

The rolling coefficient of friction is measured by the force required to operate the Ball Bushing at a constant rate of travel. The formula for determining frictional resistance during operation is as follows:

 $P_f = P \times f_r$

Where,

 P_f = Frictional resistance (lb_f)

P = Resultant of externally applied loads (lbf)

f_r = Coefficient of rolling friction

The following table describes the coefficient of rolling friction of Ball Bushing bearings operating on Thomson 60 Case* LinearRace*. These values are grouped according to the number of ball circuits in each bearing. Friction coefficients are constant among bearings having three and four ball circuits, but slightly less for bearings with five or six ball circuits. A dry Ball Bushing bearing has the lowest coefficient of friction due to the complete absence of lubricant surface tension effects. Values for grease lubrication ranges from 100% greater in the smaller sizes to 20% to 50% greater in the larger sizes. Oil lubrication (medium/heavy, viscosity 64 cs @ 100°F) achieves frictional values slightly higher than those for grease lubrication.

Ball Bushing bearing coefficients of rolling friction (f _r)								
Bearing I.D.	Number of Ball			Load in % of Rolling Load Rating (for 2,000,000 inches of travel)

lillu 4		Oil Lube	.0018	.0018	.0019	.0021	.0027	
F (0 II		No Lube	.0011	.0011	.0012	.0013	.0018	
5/8 thru 1 1/2	10	Grease Lube	.0014	.0014	.0015	.0016	.0019	
1 1/2		Oil Lube	.0016	.0016	.0017	.0019	.0025	

Coefficient of Static Friction

The coefficient of static or breakaway friction is measured by the force required to initiate Ball Bushing bearing movement. The formula used to determine static frictional resistance is:

 $P_f = P \times f_0$

where f_0 = Coefficient of static friction

The values for the coefficient of static friction or breakaway friction are not measurably affected by the number of ball circuits in the bearing or by the lubrication condition.

	Ball Bushing bearing coefficients of static friction (f _o)							
	Load in % of Rolling Load Rating							
125% 100% 75% 50% 25%								
.0028 .0030 .0033 .0036 .0040								

Seal Drag

Another variable that affects the frictional resistance in a Ball Bushing bearing system is seal drag. When seals are used to retain lubricant or to prevent entry of foreign particles, frictional resistance must be taken into account for determining total frictional drag. In applications where contamination is minimal, the seals can be removed to reduce frictional drag. In highly contaminated applications, seals, wipers and or scrapers are used to minimize the ingress of contamination into the bearing. This protective measure adds to the frictional drag of the bearing system. There is a fine line between minimizing frictional drag and maximizing contaminant protection which is controlled by the addition or removal of seals, wipers or scrapers. In applications that require low frictional drag in highly contaminated environments, contact Thomson application engineering.

Lubrication

All Thomson Ball Bushing bearings require a small amount of grease or oil to operate. For most applications, lubricant is recommended to prevent wearing and rusting of the bearing surfaces. When linear speeds are high, a light oil should be used and the bearing should be prevented from running dry for a prolonged period of time. A medium to heavy oil or light grease has greater adhesion properties that afford longer bearing protection and minimize sealing problems. The numerous built-in pockets in the Ball Bushing bearing retainer allow grease to be stored for an extended period of time. Though not generally recommended, in some lightly loaded, low speed and highly contaminated applications, Ball Bushing bearings have been used without lubrication. For these types of applications contact Thomson application engineering.

All Thomson Ball Bushing bearings are shipped with a rust preventative oil. It is recommended that you lubricate the Ball Bushing bearing prior to installation and periodically during operation to assure that the Ball Bushing bearing does not run dry. For periodic relubrication, most Thomson Ball Bushing Pillow Blocks are equipped with an access for lubrication.

Danaher Motion can provide a specially formulated lubricant, specifically developed to meet a broad range of linear bearing applications. Thomson LinearLube* lubricant is a synthetic lubricant that utilizes suspended Teflon® in a specially formulated compound. LinearLube lubricant provides excellent performance characteristics in a wide range of applications. It is FDA listed, non-polluting and non-corrosive. LinearLube lubricant will not stain and adheres tightly to parts forming a virtually water resistant barrier.

- Maintains properties in operating temperatures from –65°F to 450°F
- USDA Rated HL (Non-Toxic)
- Will not oxidize in use
- 100% water resistant

The RoundRail Advantage

The RoundRail* Advantage is the inherent ability of a Ball Bushing bearing to accommodate torsional misalignment (caused by inaccuracies in carriage or base machining or by machine deflection) with little increase in stress to bearing components (Figure 4). This important feature to all Thomson Ball Bushing* bearing systems reduces installation time and

Performance Criteria Continued

cost, while maximizing performance.

Ball Bushing Bearing vs. Linear Guide

The major difference between a Ball Bushing bearing and linear guide system is primarily in the design of the inner race. The linear guide inner race has two, four or six ground grooves that guides the carriage and the precision balls. Due to the ball conforming nature of the grooves, the carriage is prevented from accommodating torsional misalignment (Figure 5). If orsional misalignment is introduced to a linear guide system, the component stress increases, reducing life and performance. In a Ball Bushing bearing system the inner race is a hardened and ground 60 Čase* LinearRace*. Due to the lack of ground grooves, the Ball Bushing bearing system can accommodate torsional misalignment and operate without added stress to bearing components.

60 Case LinearRace/Ball Bushing Bearing Fit-up

There are three basic fit-up conditions of a Ball Bushing bearing and 60 Case LinearRace, clearance, line-to-line and preload. In most product sections there are specification tables that detail

the Ball Bushing bearing working bore diameter and 60 Case LinearRace diameter tolerance as well as the fit-up between them. The clearance, line-to-line and preload conditions are shown by the abbreviation C for clearance, P for preload and .0000 for a line-to-line condition.

The clearance between a Super Smart and Super Ball Bushing bearing and a 60 Case LinearRace is a function of the Ball Bushing bearing working bore diameter and the diameter tolerance of the 60 Case LinearRace. The working bore diameter of a Super Smart or Super Ball Bushing bearing is a function of the housing bore diameter tolerance. In applications where high accuracy and repeatability is not required, clearance is acceptable. Clearance can be achieved by following the recommended housing bore guidelines found in the product specification sections. To check for a clearance condition, simply rotate the 60 Case LinearRace inside the Super Smart or Super Ball Bushing bearing while installed in a housing bore. If you can freely rotate the 60 Case LinearRace then a clearance condition is present.

The clearance between the fixed diameter Precision Steel Ball Bushing bearing and the 60 Case LinearRace is a function of the Ball Bushing working bore and the 60 Case LinearRace diameter. When this Ball Bushing bearing is used with the recommended 60 Case LinearRace a clearance condition will always exist. For more details see the product specification sections.

In applications where accuracy and repeatability are critical, the Super Smart, Super and Precision Steel Ball Bushing bearings can be adjusted to a preload fit-up. The Super Smart and Super Ball Bushing bearings are inherently adjustable and when installed in a adjustable housing bore a preload condition can be achieved. In a nonadjustable housing a preload condition can be obtained by making the size of the housing bore smaller or by increasing the diameter of the 60 Case LinearRace. To test for a preload condition in an adjustable or nonadjustable housing, simply rotate the 60 Case LinearRace inside the Ball Bushing bearing while it is installed in the housing bore. If a slight drag is felt then a preload condition is present. When an adjustable housing is used the preload can be altered slightly. The Super Smart and Super Ball Bushing bearing are more tolerant to preload than the Precision Steel Ball Bushing bearing. Preload on a Super Smart and Super Ball Bushing bearing should be a maximum of .001 inch per inch of 60 Case LinearRace diameter. Preload on a Precision Steel Ball Bushing bearing should be a maximum of .0001 inch per inch of 60 Case LinearRace diameter. When all Ball Bushing bearings are preloaded, extra care must be taken in mounting the 60 Case LinearRace parallel.

Line-to-Line

A line-to-line fit-up condition between a Ball Bushing bearing and 60 Case LinearRace is when no clearance or preload is present. A line-to-line fit-up can be achieved in an adjustable or fixed diameter housing. For more details see the product specification sections.

Engineering

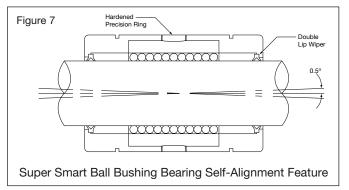

Self-Alignment

The Super Smart* and Super Ball Bushing* bearings are equipped with a built-in self-alignment feature that allows the bearing to absorb misalignment up to 0.5° per inch (Figure 6 and 7). This self-aligning feature allows the Super Smart and

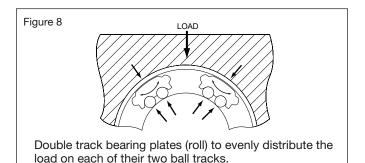

Super Ball Bushing bearing to absorb misalignment caused by inaccuracies in housing bore alignment or 60 Case LinearRace deflection.

This rocking capability also provides smooth entry and exit of the precision balls into and out of the load zone assuring a constant low coefficient of friction. By compensating for misalignment, each bearing ball in the load carrying area is uniformly loaded providing maximum load capacity. Besides this rocking capability, only the Super Smart Ball Bushing Bearing provides two additional self-alignment features. They are Roll and Yaw.

Roll

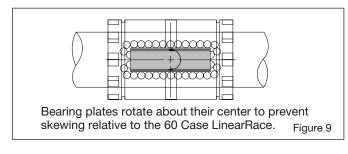

The Super Smart Ball Bushing bearing plate is designed with the radius of its outer surface smaller than the inside radius of the precision outer ring (Figure 8). This feature allows the bearing plate to compensate for torsional misalignment and evenly distribute the load on each of its two ball tracks. The roll component assures maximum load capacity and travel life.

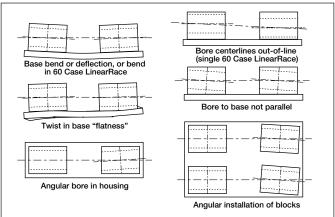

Yaw

The shape formed by the Rock and Roll features allows the Super Smart Ball Bushing bearing plate to rotate about its center (Figure 9). This allows the Super Smart Ball Bushing bearing to absorb skew caused by misalignment. The result is a constant low coefficient of friction and maximum bearing performance.

The diagrams below describe the conditions to which Super Smart and Super Ball Bushings automatically self-align. It is important to note that even though the Super Smart and Super Ball Bushing bearings self-align, they still cannot absorb an out-of-parallel 60 Case* LinearRace* condition. Tolerance to 60 Case LinearRace out-of-parallelism is a function of clearance between the bearing and its 60 Case LinearRace.

Ball Bushing Bearing Life Expectancy and Load Capacity

There are many factors that affect Ball Bushing* bearing travel life such as 60 Case* LinearRace* hardness, the resultant load, the direction of the resultant load and Ball Bushing bearing orientation. The dynamic load capacities and travel life graphs given in the specification tables found in each product section are based on a load applied at 90° relative to the horizontal plane with the Ball Bushing bearing oriented as shown in each corresponding polar graph. The dynamic load capacity is also based on using only Thomson specified 60 Case LinearRace that is hardened to HRC 60 minimum.

For considerations other than those described above, the following formula is used:

$$W_{\scriptscriptstyle R} \ = \ \frac{P}{K_O {\scriptstyle \bullet} K_S {\scriptstyle \bullet} K_L}$$

Where:

W_R = required dynamic load capacity (lb_f)

P = resultant of externally applied loads (lb_f)

K_O = factor for direction of resultant load

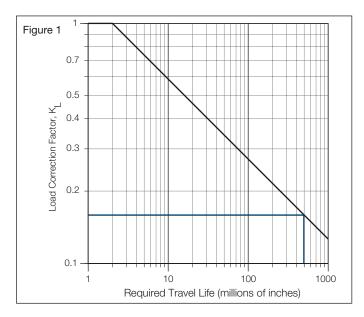

K_s = shaft hardness factor

(Equals 1.0 for 60 Case LinearRace)

 K_1 = load correction factor

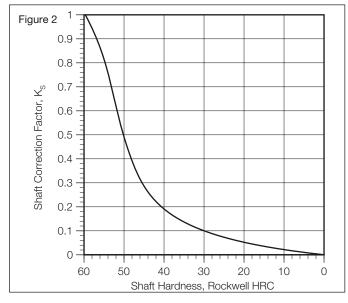

Travel Life

The load correction factor, K_L , can be found from Figure 1. To determine K_L , simply enter the chart with your required travel life and intersect the curve.

60 Case LinearRace Hardness

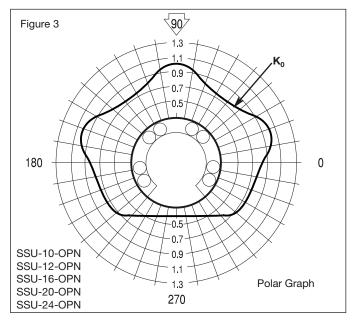

For shafts that do not meet 60 Case LinearRace hardness specifications, shaft hardness factor \mathbf{K}_{S} must be applied. To determine \mathbf{K}_{S} , simply enter Figure 2 with your shaft Rockwell hardness and intersect the curve.

Load Direction

In applications where the direction of the applied load is known, refer to the polar graphs on the product specification pages for the load correction factor, \mathbf{K}_0 . A polar graph is referenced in Figure 3 for example.

Once you have determined your required dynamic load capacity refer to the product specification table for the proper Ball Bushing bearing size.

Note: Thomson Linear Ball Bushing bearings are precision components. To preserve bearing warranty you must use the specified Thomson 60 Case LinearRace.

Engineering

Ball Bushing Bearing Size and Selection

The primary factors that influence the choice of bearing size are maximum load on a single Ball Bushing* bearing and required travel life. To determine the maximum load on a single Ball Bushing bearing refer to load considerations on page 138. To determine the required travel life refer to the following formula:

$$L_t = 2 \cdot s \cdot f \cdot L_h \cdot 60$$

Where:

L_t = required travel life in inches

s = stroke in inches

f = frequency in cycles per minute

 L_h = service life in hours

Once you have determined the maximum load on a single Ball Bushing bearing and the required travel life, enter the chart (Figure 4) and mark where the two lines intersect. All Ball Bushing bearings with curves that pass through, or above and to the right of that point may be suitable for the application.

Sample Calculation 1:

Determining the correct Ball Bushing bearing for your application.

In this example, a Super Smart Ball Bushing bearing end supported system is subjected to a load of 500 lb_f. The load is distributed equally over four Super Smart Ball Bushing bearings. The carriage reciprocates over a 12 inch stroke at a frequency of 100 complete cycles per minute. The minimum service life required is 3500 hours.

The first step is to determine the average load on each Super Smart Ball Bushing bearing.

$$P = 500/4 = 125 lb_f$$

Next, determine the equivalent travel life in inches.

L₊ = required travel life in inches

 $L_t = 2 \cdot s \cdot f \cdot L_h \cdot 60$

 $L_t = 2.12.100.3500.60$

 $L_{t} = 5.04 \times 10^{8}$ inches

Enter Figure 4 with a maximum load capacity on a single bearing of 125 lb $_{\rm f}$ and a required travel life of 5.04 x 10 $^{\rm s}$ inches. All Super Smart Ball Bushing bearing curves that pass through or above and to the right of that point, may be suitable for the application. For this application we will choose the SSU-12.

Sample calculation 2:

Determining the correct Super Smart Ball Bushing bearing for your application.

In this example, an open type Super Smart Ball Bushing bearing continuously supported system is subjected to a load of 500 lb_f and is hung upside down from the ceiling. The load is distributed equally over four Super Smart Ball Bushing bearings and the factor for the direction of the resultant load is .45 (Figure 3, page 136).

The carriage reciprocates over a 12 inch stroke at a frequency of 100 complete cycles per minute. The minimum service life required is 3500 hours.

The first step is to determine the average load on each Super Smart Ball Bushing bearing.

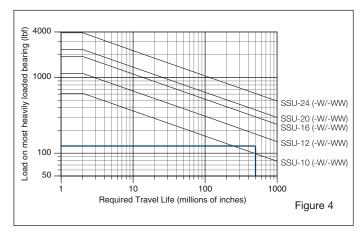

$$P = 500/4 = 125 lb_f$$

Determine the equivalent travel life in inches.

 $L_t = 2 \cdot s \cdot f \cdot L_h \cdot 60$

 $L_t = 2.12.100.3500.60$

 $L_t = 5.04 \times 10^8$ inches

Enter Figure 1 and determine K_L

The next step is to determine the required dynamic load capacity.

$$W_R = -\frac{P}{K_0 \cdot K_S \cdot K_L}$$

(K_S = 1, since we are using a Thomson 60 Case LinearRace HRC 60 minimum.)

$$W_{R} = \frac{125}{.45 \cdot 1 \cdot .17}$$

$$W_R = 1633 \, lb_f$$

To determine the proper Super Smart Ball Bushing bearing size enter the specification table on page 28. Choose the Super Smart Ball Bushing bearing with a load capacity higher than 1633 lb_f. The SSU-12-OPN has a dynamic load capacity of 1130 lb_f and the SSU-16-OPN has a dynamic load capacity of 1900 lb_f. The SSU-16-OPN is therefore the proper choice.

Load Consideration

When designing a linear motion system it is necessary to consider how the variables of operation will affect performance.

The following examples demonstrate how the position of the load and the center of gravity can influence the product selection. When evaluating your application, review each of the forces acting on your system and determine the product best for your needs.

Terms:

d₀ = distance between centerlines of pillow blocks

d₁ = distance between centerlines of 60Case LinearRace ways

d₂ = distance from centerline of carriage to load action point

d₃ = distance from centerline of carriage to load action point

W = Load (lb_f)

F_{NX} = Force in the X-axis direction (lb_f)

F_{NY} = Force in the Y-axis direction (lb_f)

 F_{NZ} = Force in the **Z-axis** direction (lb_f)

$$F_{1Z} = \ \frac{W}{4} + \left(\frac{W}{2} \bullet \frac{d_2}{d_0}\right) - \ \left(\frac{W}{2} \bullet \frac{d_3}{d_1}\right)$$

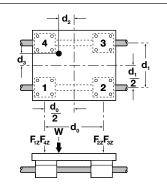

$$\mathsf{F}_{\mathsf{2Z}} = \frac{\mathsf{W}}{\mathsf{4}} - \left(\frac{\mathsf{W}}{\mathsf{2}} \bullet \frac{\mathsf{d}_{\mathsf{2}}}{\mathsf{d}_{\mathsf{0}}}\right) - \left(\frac{\mathsf{W}}{\mathsf{2}} \bullet \frac{\mathsf{d}_{\mathsf{3}}}{\mathsf{d}_{\mathsf{1}}}\right)$$

$$\mathsf{F}_{\mathsf{3Z}} = \frac{\mathsf{W}}{\mathsf{4}} - \left(\frac{\mathsf{W}}{\mathsf{2}} \bullet \frac{\mathsf{d}_2}{\mathsf{d}_0}\right) + \left(\frac{\mathsf{W}}{\mathsf{2}} \bullet \frac{\mathsf{d}_3}{\mathsf{d}_1}\right)$$

$$\mathsf{F}_{\mathsf{4Z}} = \ \frac{\mathsf{W}}{\mathsf{4}} + \left(\frac{\mathsf{W}}{\mathsf{2}} \bullet \frac{\mathsf{d}_{\mathsf{2}}}{\mathsf{d}_{\mathsf{0}}} \right) + \left(\frac{\mathsf{W}}{\mathsf{2}} \bullet \frac{\mathsf{d}_{\mathsf{3}}}{\mathsf{d}_{\mathsf{1}}} \right)$$

Horizontal Application I

At the time of movement with uniform velocity or at the time of stop.

$$\mathsf{F}_{\mathsf{1Z}} = \frac{\mathsf{W}}{\mathsf{4}} + \left(\frac{\mathsf{W}}{\mathsf{2}} \bullet \frac{\mathsf{d}_{\mathsf{2}}}{\mathsf{d}_{\mathsf{0}}}\right) - \left(\frac{\mathsf{W}}{\mathsf{2}} \bullet \frac{\mathsf{d}_{\mathsf{3}}}{\mathsf{d}_{\mathsf{1}}}\right)$$

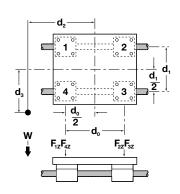

$$\mathsf{F}_{\mathsf{2Z}} = \frac{\mathsf{W}}{4} - \left(\frac{\mathsf{W}}{2} \bullet \frac{\mathsf{d}_2}{\mathsf{d}_0}\right) - \left(\frac{\mathsf{W}}{2} \bullet \frac{\mathsf{d}_3}{\mathsf{d}_1}\right)$$

$$\mathsf{F}_{3\mathsf{Z}} = \; \frac{\mathsf{W}}{4} - \left(\; \frac{\mathsf{W}}{2} \, \bullet \, \frac{\mathsf{d}_2}{\mathsf{d}_0} \; \right) \; + \; \left(\; \frac{\mathsf{W}}{2} \, \bullet \, \frac{\mathsf{d}_3}{\mathsf{d}_1} \; \right)$$

$$\mathsf{F}_{\mathsf{4Z}} = \ \frac{\mathsf{W}}{\mathsf{4}} + \left(\frac{\mathsf{W}}{\mathsf{2}} \bullet \frac{\mathsf{d}_{\mathsf{2}}}{\mathsf{d}_{\mathsf{0}}} \right) + \ \left(\frac{\mathsf{W}}{\mathsf{2}} \bullet \frac{\mathsf{d}_{\mathsf{3}}}{\mathsf{d}_{\mathsf{1}}} \right)$$

Horizontal Application II

At the time of movement with uniform velocity or at the time of stop.

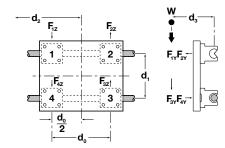

$$F_{1Y} \approx F_{4Y} = \left(\frac{W}{2} \cdot \frac{d_3}{d_1}\right)$$

$$F_{1Z} = F_{4Z} = \frac{W}{4} + \left(\frac{W}{2} \cdot \frac{d_2}{d_0}\right)$$

$$F_{2Z} = F_{3Z} = \frac{W}{4} - \left(\frac{W}{2} \bullet \frac{d_2}{d_0}\right)$$

Side Mounted Application

At the time of movement with uniform velocity or at the time of stop.

$$F_{1X} \approx F_{4X} = \frac{W}{2} \cdot \frac{d_2}{d_0}$$

$$F_{1Y} \approx F_{4Y} = \frac{W}{2} \cdot \frac{d_3}{d_0}$$

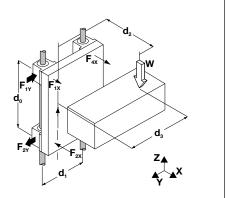

$$\mathsf{F}_{\mathsf{1X}} + \mathsf{F}_{\mathsf{4X}} \approx \mathsf{F}_{\mathsf{2X}} + \mathsf{F}_{\mathsf{3X}}$$

$$F_{1Y} + F_{4Y} \approx F_{2Y} + F_{3Y}$$

Vertical Application

At the time of movement with uniform velocity or at the time of stop.

At the time of start and stop, the load varies because of inertia.

60 Case LinearRace Deflection

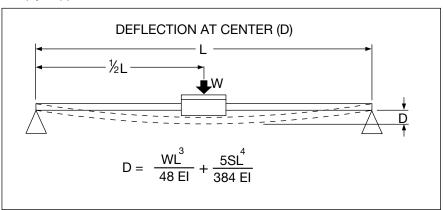

When Thomson 60 Case* LinearRace* is used in an end supported configuration it is important to ensure that 60 Case LinearRace deflections at the bearing locations are kept within performance limitations.

These equations give the deflection at the center of an end supported 60 Case LinearRace. Systems with continuous 60 Case LinearRace support are not subject to the same types of deflection.

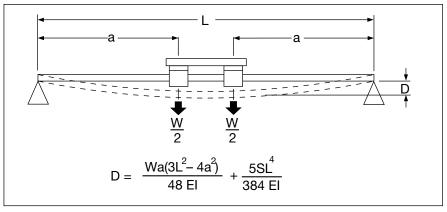

For more detailed information of the deflection characteristics of Thomson linear motion products contact application engineering.

Values for Thomson 60 Case LinearRace							
LinearRace	Sol	id	Tubula	r			
Diameter (In)	El (lb _f •in²)	S (lb _f /in)	El (lb _f ∙in²)	S (lb _f /in)

Simply Supported 60 Case LinearRace with One Block

Simply Supported 60 Case LinearRace with Two Blocks

LEGEND:

D = Deflection (in)

 $W = Load(lb_f)$

L = Length of unsupported 60 Case LinearRace (in)

a = Distance to first bearing with carriage at center position (in)

S = Unit weight of LinearRace (lb_f/in)

E = Modulus of Elasticity (lb_f • in²)

= Moment of inertia of area through diameter of LinearRace (in⁴)

Installation Guidelines

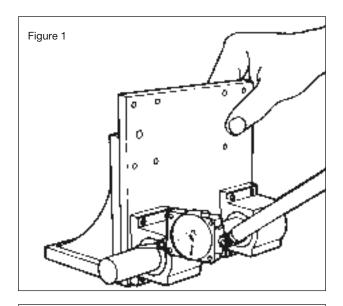

Thomson Ball Bushing bearings are manufactured to exceptionally close tolerances and offer smooth, virtually friction-free linear motion. The performance features of the bearings will only be realized, however, if care is taken during their installation.

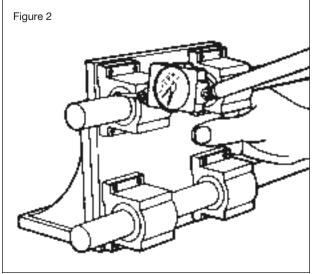

Two areas of primary importance are the bearing alignment and the 60 Case* LinearRace* parallelism. Two bearings are normally used on each 60 Case LinearRace to assure smooth operation. The housing should be carefully aligned using the method given below. If a single twin-type housing is used, these procedures are not necessary.

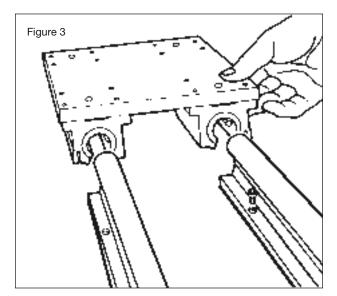

It is also necessary to assure that the height from the housing mounting surface to the 60 Case LinearRace is consistent within .001 in. Shimming may be necessary depending on the accuracy of the mounting surfaces to which the housings are bolted.

The housing can be mounted to the plate using the following procedure:

- a. Prepare the carriage plate with one side having an abutting surface.
- Mount two housings with the reference edges located against the abutting surface and tighten the hold down bolts.
 Figure 1
- Mount the second pair of housings on the opposite side of the carriage and tighten the bolts finger tight.
- d. Insert a locating 60 Case LinearRace of correct diameter and tolerance through these two housings and reference the distance from the abutting surface in [b] above, to this locating 60 Case LinearRace. Figure 2
- e. After appropriate alignment of this pair of housings, tighten bolts to secure housings to carriage.

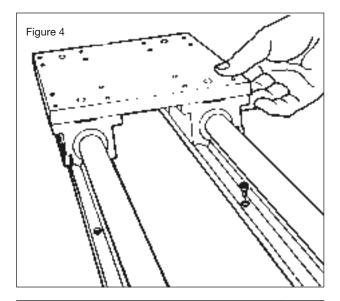

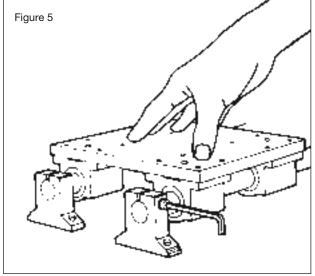

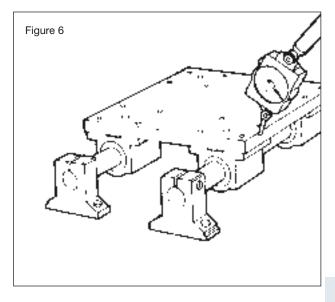

After the carriage is properly prepared, the 60 Case* LinearRace* must be mounted to the surface. To achieve smooth, accurate motion, the 60 Case LinearRace must be mounted parallel within .001 inch over the length of the stroke. This can be done by using the following procedure:

- a. Mount one 60 Case LinearRace (either end supported or continuously supported) to the surface with mounting bolts finger tight.
- Using an aligning device such as a laser, auto-collimator or other optics, sight the 60 Case LinearRace straight and secure to mounting surface.
- After this first 60 Case LinearRace is fixed, the second 60 Case LinearRace can be positioned and held down with bolts finger tight.
- d. The carriage is then mounted and its movement will pull this second 60 Case LinearRace parallel to the first. Figures 3, 4
- e. If the second 60 Case LinearRace is then secured into position, the procedure is complete. Note that for continuously supported systems, this securing should be done when the carriage is close to the bolts. For end supported systems, the securing should be done when the carriage is at the ends of the 60 Case LinearRace. Figure 5
- f. An additional check can be done at this time to assure that the carriage is tracking correctly (i.e., that the carriage edge is moving parallel to the 60 Case LinearRace). An indicator touching the carriage edge should not vary, as the carriage is moved along the 60 Case LinearRace. Figure 6

Application Tips

Two Ball Bushing* Bearings per 60 Case* LinearRace* When using the Super Smart, Super or Precision Steel Ball Bushing bearing it is recommended that two Ball Bushings bearings be used on each 60 Case LinearRace. This will assure

system stability as well optimum performance. If envelope constraints prohibit the use of two Ball Bushing bearings per 60 Case LinearRace contact application engineering.

Ball Bushing Bearing Spacing vs. 60 Case LinearRace **Spacing**

In parallel 60 Case LinearRace applications, the ratio of 60 Case LinearRace spacing to Ball Bushing bearing spacing should always be less than three to one. This will assure a constant breakaway and operating friction.

60 Case LinearRace Parallelism

In most applications the maximum acceptable out of parallelism condition is .001 inch over the entire full system length. In applications where preload is present (such as when using Die Set Ball Bushing bearings) a closer 60 Case LinearRace parallelism is recommended.

Three or More Parallel 60 Case LinearRace ways When aligning two 60 Case LinearRace ways parallel great care is required to assure a parallelism within .001 inch over the entire length of travel. When aligning multiple 60 Case LinearRace ways, parallelism between each 60 Case LinearRace should be held within the .001 inch specification.

Measuring 60 Case LinearRace Alignment

Methods for establishing or checking 60 Case LinearRace straightness and parallelism depends on the accuracy required. Lasers, collimator or alignment telescopes can be used for very precise applications, while accurate levels, straight edges, micrometers and indicators will suffice for the majority of applications which have less stringent accuracy requirements.

Installation of Super and Precision Steel Adjustable Type **Ball Bushing Bearings**

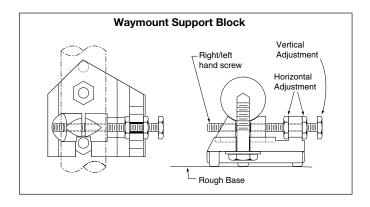

When installing a Super Ball Bushing bearing into a slotted adjustable housing, the bearing plate should not align with the adjustment slot. When installing a Precision Steel Adjustable Type Ball Bushing bearing into a slotted adjustable housing, the bearing adjustment slot should be 90° to the pillow block adjustment slot. These important steps will assure accurate bearing adjustment.

Access for Lubrication

Thomson Super Smart and Super Ball Bushing Pillow Blocks are equipped with either an oil lubrication fitting or a 1/4-28 access for lubrication. To use the oil fitting simply insert a lubrication device into the oil nipple by depressing the spring loaded ball. The ¹/₄-28 tapped hole is a standard size for most grease and lubrication fittings. Simply install the lubrication fitting of your choice and it is ready for immediate use. Super Ball Bushing Pillow blocks in sizes .250 through .500 inch diameter are equipped with oil lubrication fittings. Super Ball Bushing pillow blocks in sizes .625 inch and above and all Super Smart Ball Bushing Pillow Blocks are equipped with a 1/4-28 access for lubrication.

Waymount Support Block for Roundway Bearing Installation

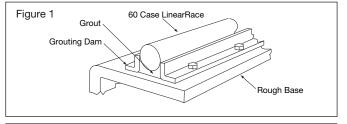

Standard Waymount LinearRace Support Blocks provide 60 Case LinearRace adjustment in both the horizontal and vertical direction. This product reduces installation time dramatically, while assuring precise 60 Case LinearRace alignment. This versatile design allows the Waymount support to be mounted vertically or horizontally and in many different Roundway bearing applications. The number of Waymounts to be used is based on the maximum allowable 60 Case LinearRace deflection between supports and the accuracy required. Ordinarily indicators, sensitive levels and straight edges are adequate for most alignment conditions.

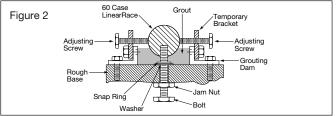

RoundWay* Bearing/60 Case LinearRace **Installation Using Grout**

Grouting is a very simple method of mounting a 60 Case LinearRace on almost any kind of surface, smooth or uneven. Grouting can also be used in conjunction with standard Waymount LinearRace support blocks or other 60 Case LinearRace supports to obtain maximum rigidity. Dams are fastened to the bed parallel to the 60 Case LinearRace which is then aligned with its mating 60 Case LinearRace (Figure 1). A compound, such as Thomson Waystone*, is then poured under and around the lower circumference of the 60 Case LinearRace. This dries quickly forming a solid support of high compressive strength (over 12,000 psi) without affecting the initial straightness of the LinearRace.

If the bearing arrangement permits the grout to flow substantially around the circumference of the 60 Case LinearRace and side loads are light, Waymount LinearRace supports or other hold down bolts along the length made be unnecessary (Figure 2). Just one support at each end of the 60 Case LinearRace will usually provide final alignment and hold the 60 Case Linear-Race in position for grouting. If the length to diameter ratio is large, Waymount LinearRace supports should be equally spaced to minimize 60 Case LinearRace deflection. Grout should always be in direct contact with the surface of the bed or whatever base member provides primary rigidity and support.

However, it is the responsibility of the product user to determine the suitability of Thomson products for a specific application. While defective products will be replaced without charge if promptly returned, no liability is assumed beyond such replacement

60 Case LinearRace Shafting Specifications

Thomson 60 Case* LinearRace* provides the inner race for Thomson Ball Bushing bearings. All 60 Case LinearRace is manufactured to extremely close tolerances for surface finish, roundness, hardness and straightness to provide long service life with reduced maintenance.

Specifications:

Hardness: HRC 60 minimum

Surface Finish: 12 R_a microinch

Roundness: 80 millionths of an inch

Straightness: Standard—.001 inch per foot cumulative (.002 TIR) Special—.0005 inch per foot

cumulative (.001 TIR)

Length Tolerance: Standard +/-.030 inch for diameters up to

2 inches and +/-.060 for diameters 2 inch and over. Special length tolerances avail-

able.

Chamfer: Standard chamfer on diameters up to 1

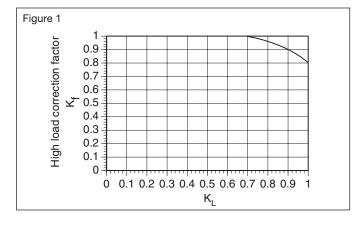

inch is .030 x 45° and .060 x 45° for

diameters larger than 1 inch.

Tensile Strength: Case: 335,000 psi, Core: 100,000 psi **Yield Strength:** Case: 250,000 psi, Core: 75,000 psi

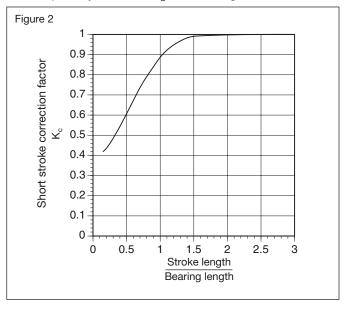

Load Factor

In applications where the applied load exceeds 70% of the maximum dynamic load capacity of Super Smart Ball Bushing bearings, a high load correction factor $K_{\rm f}$ must be applied to $W_{\rm R}$ when calculating travel life. (Figure 1)

Short Stroke Applications

In applications when the stroke length is short, the life of the shaft is shorter than that of the Ball Bushing bearing. In short stroke applications, the required dynamic load capacity must be multiplied by the factor $K_{\rm C}$ found on Figure 2.

Material engineering specifications

Ball Bushing* bearing materials.

The following is a tabulation of the materials used for the components of the various types of Ball Bushing bearings

Туре	Outer Sleeve	Ball Retainers	Bearing Plates	Balls	End Rings
SSU, SUPER Ball Bushing Bearings	Delrin	Delrin	8620	Chrome Steel	None
Series A, B, XA, ADJ, OPN and DS	E52100	Steel	_	Chrome Steel	Steel
Stainless Steel (SS) to 1" I.D. Series A, XA, ADJ and OPN	440A	Type 305SS	_	440C	Type 303SS
Series INST-SS	440A	Brass	_	440C	None
Series XR	Reinforced Nylon	Reinforced Polyester	8620	Chrome Steel	Steel

Corrosion resistance

Super Ball Bushing bearings can be supplied corrosion resistant with hard chromeplated bearing plates and stainless steel balls. Load capacity will be 70% of regular Super Ball Bushing bearings. To order, add suffix CR to Super Ball Bushing bearingpart number. Contact factory for price and delivery information.

For limited protection against atmospheric corrosion, large sizes (over 1" diameter) of series A, XA, ADJ, OPN and B, Ball Bushing bearings can be supplied with stainless steel balls and black oxide sleeve. Load capacity will be 70% of regular steel bearings. To order, add suffix SP to bearing part number. Contact factory for price and delivery.

Stainless steel Ball Bushing bearings

Available entirely of stainless steel. They are identified by the suffix "SS" following the part number (i.e. XA-81420-SS).

Sizes available:

Series A and XA	to and including 1"
Series ADJ and OPN	1/2", 5/8", 3/4" and 1"

Ball Bushing bearings with nylon balls

For extremely quiet operation, Ball Bushing bearings fitted with Nylon balls can be supplied in sizes 1/2" and larger. For estimating purposes laod ratings should be considered about 10% of those listed for Ball Bushing bearings with steel balls. Prices and other information available on request.

60 Case* shafts -hardened and ground

Material Type	AISI	Rockwell "C"
Solid 60 Case	Bearing-quality, high carbon alloy steeel	60 min
Tubular 60 Case	Bearing-quality, high carbon alloy steel	58 min
Solid Stainless Steel	440C Stainless	50 min

Maximum recommended operating temperatures for Ball Bushing bearings

The following are general recommendations. For additional information or more specific recommendations please contact factory with full application details.

Type of Ball Bushing bearings	Maximum Operating Temperature	Load Rating at Maximum Operating Temperature as % of Catalog Load Rating
SSU, Super & Series XR	185°F	100%
Series A, B, XA, ADJ & OPN	500°F†	70%
Series A-SS, XA-SS, ADJ-SS, OPN-SS & INST-SS Stainless Steel (through 1" I.D.)	600°F†	60%

'Maximum operating temperature for these two series for *full catalog load* rating is 300°F.

Note: Type PB-A, PB-ADJ, and PBO-OPN pillow blocks are assembled with Delrin plastic seal covers with a maximum operature at 185°F.

Pillow blocks and shaft supports

Part Type	Material
Type SSUPB, SSUTWN, SPB & TWN pillow blocks	Type 6061-T6511 Aluminum
Type PB pillow blocks	Ductile Iron
Type PBO & XPBO Pillow blocks	Malleable/Ductile Iron
Type SR shaft support rails (std. lgth. 24")	Type 6061-T6511 Aluminum
Type LSR shaft support rails	1010 Steel
Type XSR shaft support rails (std. lgth. 24")	Ductile Iron
Type SB shaft support blocks	Malleable Iron ^{††}
Waymount shaft supports	Malleable Iron Base with steel adjustment elements

 $^{^{\}scriptsize\textrm{ti}}\textsc{Type}$ 6061-T6511 Aluminum for 1/4" and 3/8" sizes only
